Cartan Calculus on the Quantum Space $R_q^3$

Salih Çelik, E. Mehmet Özkân, Ergün Yaşar

Abstract

To give a Cartan calculus on the extended quantum 3d space, the noncommutative differential calculus on the extended quantum 3d space is extended by introducing inner derivations and Lie derivatives.

Key Words: Quantum space, Hopf algebra, Lie algebra, inner derivation, Lie derivation.

1. Introduction

The noncommutative differential geometry of quantum groups was introduced by Woronowicz [11, 12]. In this approach the differential calculus on the group is deduced from the properties of the group and it involves functions on the group, differentials, differential forms and derivatives. The other approach, initiated by Wess and Zumino [10], followed Manin’s emphasis [5] on the quantum spaces as the primary objects. Differential forms are defined in terms of noncommuting coordinates, and the differential and algebraic properties of quantum groups acting on these spaces are obtained from the properties of the spaces.

The differential calculus on the quantum 3d space similarly involves functions on the 3d space, differentials, differential forms and derivatives. The exterior derivative is a linear operator $d$ acting on $k$-forms and producing $(k+1)$-forms, such that for scalar functions ($0$-forms) $f$ and $g$ we have

$$d(1) = 0, \quad d(fg) = (df)g + (-1)^{deg(f)} f(dg),$$

where $deg(f) = 0$ for even variables and $deg(f) = 1$ for odd variables, and for a $k$-form $\omega_1$ and any form $\omega_2$

$$d(\omega_1 \wedge \omega_2) = (d\omega_1) \wedge \omega_2 + (-1)^k \omega_1 \wedge (d\omega_2).$$

A fundamental property of the exterior derivative $d$ is

$$d \wedge d =: d^2 = 0.$$

There is a relationship of the exterior derivative with the Lie derivative and to describe this relation, we introduce a new operator: the inner derivation. Hence the differential calculus on the quantum 3d space can

AMS Mathematics Subject Classification: 17B37; 81R60
be extended into a large calculus. We call this new calculus the Cartan calculus. The connection of the inner derivation denoted by $i_a$ and the Lie derivative denoted by $\mathcal{L}_a$ is given by the Cartan formula:

$$\mathcal{L}_a = i_a \circ d + d \circ i_a.$$ 

This and other formulae are explained in Ref. [6–8]. We now shall give a brief overview without much discussion.

Let us begin with some information about the inner derivations. Generally, for a smooth vector field $X$ on a manifold the inner derivation, denoted by $i_X$, is a linear operator which maps $k$-forms to $(k - 1)$-forms. If we define the inner derivation $i_X$ on the set of all differential forms on a manifold, we know that $i_X$ is an antiderivation of degree $-1$:

$$i_X (\alpha \wedge \beta) = (i_X \alpha) \wedge \beta + (-1)^k \alpha \wedge (i_X \beta),$$

where $\alpha$ and $\beta$ are both differential forms. The inner derivation $i_X$ acts on 0- and 1-forms as follows:

$$i_X (f) = 0, \quad i_X (df) = X(f).$$

We know, from the classical differential geometry, that the Lie derivative $\mathcal{L}$ can be defined as a linear map from the exterior algebra into itself which takes $k$-forms to $k$-forms. For a 0-form, that is, an ordinary function $f$, the Lie derivative is just the contraction of the exterior derivative with the vector field $X$:

$$\mathcal{L}_X f = i_X df.$$

For a general differential form, the Lie derivative is likewise a contraction, taking into account the variation in $X$:

$$\mathcal{L}_X \alpha = i_X d\alpha + d(i_X \alpha).$$

The extended calculus on the quantum plane was introduced in Ref. 1 using the approach of Ref. [7]. In this work we explicitly set up the Cartan calculus on the quantum 3d space using approach of Ref. [2].

2. Review of the Calculus on the Quantum 3d Space

In this section we give some information on the differential calculus on the quantum 3d space [3] which we shall use in order to establish our notions.

2.1. The algebra of polynomials on the quantum 3d space

The quantum three dimensional space is defined as an associative algebra generated by three noncommuting coordinates $x$, $y$ and $z$ with three quadratic relations:

$$xy = qyx, \quad yz = qzy, \quad zx = qzx,$$

where $q$ is a non-zero complex numbers. This associative algebra over the complex number is known as the algebra of polynomials over the quantum 3d space and we shall denote it by $\mathcal{R}_q^3$. We define the extended quantum 3d space to be the algebra that contains $\mathcal{R}_q^3$, the unit and $x^{-1}$, the inverse of $x$, which obeys

$$xx^{-1} = 1 = x^{-1}x.$$ 

We denote the extended algebra by $\mathcal{A}$. We know that the algebra $\mathcal{A}$ is a Hopf algebra [3].
2.2. Differential algebra

A deformed differential calculus on the quantum 3d space is as follows [3]:

- the commutation relations with the coordinates of differentials

\[
\begin{align*}
xdx &= dxx, \quad xdy = qdyx, \quad xdz = qdzx, \\
qdx &= q^{-1}dxy, \quad qdy = dyy, \quad qdz = qdz, \\
zdx &= q^{-1}dxx, \quad zdy = q^{-1}dyz, \quad zdz = dzz;
\end{align*}
\] (2)

- the commutation relations between the differentials

\[
\begin{align*}
dx \wedge dy &= -qdy \wedge dx, \quad dx \wedge dx = 0, \\
dx \wedge dz &= -qdz \wedge dx, \quad dy \wedge dy = 0, \\
dy \wedge dz &= -qdz \wedge dy, \quad dz \wedge dz = 0,
\end{align*}
\] (3)

- the relations of the coordinates with their partial derivatives

\[
\begin{align*}
\partial_x x &= 1 + x \partial_x, \quad \partial_x y = q^{-1}y \partial_x, \quad \partial_x z = q^{-1}z \partial_x, \\
\partial_y x &= qx \partial_y, \quad \partial_y y = 1 + y \partial_y, \quad \partial_y z = q^{-1}z \partial_y, \\
\partial_z x &= qx \partial_z, \quad \partial_z y = qy \partial_z, \quad \partial_z z = 1 + z \partial_z;
\end{align*}
\] (4)

- the relations of partial derivatives

\[
\begin{align*}
\partial_x \partial_y &= q \partial_y \partial_x, \quad \partial_x \partial_z = q \partial_z \partial_x, \quad \partial_z \partial_z = q \partial_z \partial_y;
\end{align*}
\] (5)

- the relations between partial derivatives and differentials are found as

\[
\begin{align*}
\partial_x dx &= dxx \partial_x, \quad \partial_x dy = q^{-1}dyy \partial_x, \quad \partial_x dz = q^{-1}dzz \partial_x, \\
\partial_y dx &= q dx \partial_y, \quad \partial_y dy = dy \partial_y, \quad \partial_y dz = q^{-1}dz \partial_y, \\
\partial_z dx &= q dx \partial_z, \quad \partial_z dy = qdy \partial_z, \quad \partial_z dz = dz \partial_z.
\end{align*}
\] (6)

These relations will be used in section 5.

3. Hopf Algebra Structure of Quantum Lie Algebra

In this short section we shall give the Hopf algebra structure of the Lie algebra generators. In Ref. [3], the commutation rules of the quantum Lie algebra generators found as

\[
[T_x, T_y] = 0, \quad [T_x, T_z] = 0, \quad [T_y, T_z] = 0.
\] (7)
The Hopf algebra structure of the Lie algebra generators is given by
\[
\begin{align*}
\Delta(T_x) &= T_x \otimes 1 + 1 \otimes T_x, \\
\Delta(T_y) &= T_y \otimes 1 + q^{T_x} \otimes T_y, \\
\Delta(T_z) &= T_z \otimes 1 + q^{T_x} \otimes T_z,
\end{align*}
\]
(8)
\[
\epsilon(T_x) = 0, \quad \epsilon(T_y) = 0, \quad \epsilon(T_z) = 0,
\]
\[
S(T_x) = -T_x, \quad S(T_y) = -q^{-T_x}T_y, \quad S(T_z) = -q^{-T_x}T_z.
\]

We show in the next section that this Hopf algebra structure are consistent with the dual Hopf algebra structure.

4. The Dual of the Hopf Algebra $A$

In this section, in order to obtain the dual of the Hopf algebra $A$ defined in section 2, we shall use the method of Refs. [4] and [9].

As a Hopf algebra $A$ is generated by the elements $x$, $x^{-1}$, $y$, and $z$, and a basis is given by all monomials of the form
\[
f = x^k y^l z^m
\]
where $k, l, m \in \mathbb{Z}_+$. Let us denote the dual algebra by $U_q$ and its generating elements by $X$, $Y$ and $Z$.

The pairing is defined through the tangent vectors as
\[
\begin{align*}
\langle X, f \rangle &= k \delta_{l,0} \delta_{m,0}, \\
\langle Y, f \rangle &= \delta_{l,1} \delta_{m,0}, \\
\langle Z, f \rangle &= \delta_{l,0} \delta_{m,1}.
\end{align*}
\]
(9)

We also have
\[
\langle 1_u, f \rangle = \epsilon_A(f) = \delta_{k,0}.
\]

Using relations (9), one gets
\[
\langle XY, f \rangle = \delta_{l,1} \delta_{m,0} \quad \text{and} \quad \langle YX, f \rangle = \delta_{l,1} \delta_{m,0}
\]
where differentiation is from the right as this is most suitable for differentiation in this basis. Thus we obtain one of the commutation relations in the algebra $U_q$ dual to $A$ as:
\[
XY = YX.
\]

Similarly, one has
\[
XZ = ZX, \quad YZ = ZY.
\]

The Hopf algebra structure of this algebra can be deduced by using the duality. The coproduct of the elements of the dual algebra is given by
\[
\begin{align*}
\Delta_u(X) &= X \otimes 1_u + 1_u \otimes X, \\
\Delta_u(Y) &= Y \otimes q^{-X} + 1_u \otimes Y, \\
\Delta_u(Z) &= Z \otimes q^{-X} + 1_u \otimes Z.
\end{align*}
\]
The counit is given by
\[ \epsilon_U(X) = 0, \quad \epsilon_U(Y) = 0, \quad \epsilon_U(Z) = 0. \]
The coinverse is given as
\[ S_U(X) = -X, \quad S_U(Y) = -YqX, \quad S_U(Z) = -ZqX. \]
We can now transform this algebra to the form obtained in section 3 (eq. 8) by making the identities
\[ T_x \equiv X, \quad T_y \equiv q^{X/2}Yq^{X/2}, \quad T_z \equiv q^{X/2}Zq^{X/2}, \]
which are consistent with the commutation relation and the Hopf structures.

5. Extended Calculus On The Quantum 3d Space

The Lie derivative is closely related to the exterior derivative. The exterior derivative and the Lie derivative are set to cover the idea of a derivative in different ways. These differences can be hasped together by introducing the idea of an antiderivation which is called an inner derivation.

5.1. Inner derivations

In order to obtain the commutation rules of the coordinates with inner derivations, we shall use the approach of Ref. [2]. Similarly other relations can also obtain.

We now wish to find the commutation relations between the coordinates \( x, y, z \) and the inner derivations associated with them. In order to obtain the commutation rules of the coordinates with inner derivations, we shall assume that they are of the form
\[
\begin{align*}
ix_x &= A_1 x_1 + A_2 y_2 + A_3 z_3, \\
ix_y &= A_4 y_1, \\
ix_z &= A_5 x_1 + A_6 y_2, \\
iz_x &= A_7 x_1 + A_8 y_2, \\
iz_y &= A_9 z_3, \\
iz_z &= A_{10} z_1 + A_{11} x_1 + A_{12} x_2, \\
iz_x &= A_{13} z_2 + A_{14} y_2, \\
iz_y &= A_{15} y_2 + A_{16} z_3, \\
iz_z &= A_{17} y_2 + A_{18} z_3 + A_{19} z_1 + A_{20} x_1 + A_{21} y_2.
\end{align*}
\]

The coefficients \( A_k \) \((1 \leq k \leq 21)\) will be determined in terms of the deformation parameter \( q \). But the use of the relations (1) does not give rise any solution in terms of the parameter \( q \). However, we have, at least, the system
\[
\begin{align*}
A_5(A_1 - qA_3) &= 0, & A_2A_{11} - q^2 A_5A_9 &= 0, & A_2A_{14} &= 0, \\
A_2(A_{10} - qA_4) &= 0, & A_3A_{20} - q^2 A_7A_{16} &= 0, & A_3A_{18} &= 0, \end{align*}
\]
etc.
To find the coefficients, we need the commutation relations of the inner derivations with the differentials of $x$, $y$, and $z$. Since

$$i_X(dX_j) = \delta_{ij},$$

we can assume that the relations between the differentials and the inner derivations are of the form

$$i_x \wedge dx = 1 + a_1 dx \wedge i_x + a_2 dy \wedge i_y + a_3 dz \wedge i_z,$$

$$i_x \wedge dy = a_4 dy \wedge i_x + a_5 dx \wedge i_y,$$

$$i_x \wedge dz = a_6 dz \wedge i_x + a_7 dx \wedge i_z,$$

$$i_y \wedge dx = a_8 dx \wedge i_y + a_9 dy \wedge i_x,$$

$$i_y \wedge dy = 1 + a_{10} dy \wedge i_y + a_{11} dx \wedge i_x + a_{12} dz \wedge i_z,$$

$$i_y \wedge dz = a_{13} dz \wedge i_y + a_{14} dy \wedge i_z,$$

$$i_z \wedge dx = a_{15} dx \wedge i_z + a_{16} dz \wedge i_x,$$

$$i_z \wedge dy = a_{17} dy \wedge i_z + a_{18} dz \wedge i_y,$$

$$i_z \wedge dz = 1 + a_{19} dz \wedge i_z + a_{20} dx \wedge i_x + a_{21} dy \wedge i_y.$$  \hfill (11)

Applying $i_x$, $i_y$, and $i_z$ to the relations (2), one gets

- $A_1 = 1$, $A_2 = 0$, $A_3 = 0$, $A_4 = q^{-1}$,
- $A_5 = 0$, $A_6 = q^{-1}$, $A_7 = 0$, $A_8 = q$,
- $A_9 = 0$, $A_{10} = 1$, $A_{11} = 0$, $A_{12} = 0$,
- $A_{13} = q^{-1}$, $A_{14} = 0$, $A_{15} = q$, $A_{16} = 0$,
- $A_{17} = q$, $A_{18} = 0$, $A_{19} = 1$, $A_{20} = 0$, $A_{21} = 0$,

and

- $a_3(qA_1 - A_{15}) = 0$, $A_2a_3 - a_2A_3 = 0$, $A_2a_{12} = 0$,
- $A_3(a_{15} - qa_1) = 0$, $A_2a_{16} - a_3A_{16} = 0$, $A_3a_{18} = 0$, etc.

To find the coefficients $a_k$ ($1 \leq k \leq 21$), we use the expression

$$i_a \circ d - F_i d \circ i_a = \partial_a, \quad \text{for} \quad a \in \{x, y, z\}.$$  \hfill (12)

For example, using the first relation in (10) with the relations (4), we obtain

$$F_1 = -1, \quad a_1 = -1, \quad a_2 = 0 = a_3.$$  \hfill (13)

Other coefficients can be similarly obtained. Consequently, we have the following commutation relations.

- The commutation relations of the inner derivations with $x$, $y$, and $z$:

$$i_x x = x i_x, \quad i_x y = q^{-1} y i_x, \quad i_x z = q^{-1} z i_x,$$

$$i_y x = q x i_y, \quad i_y y = y i_y, \quad i_y z = q^{-1} z i_y,$$

$$i_z x = q x i_z, \quad i_z y = q y i_z, \quad i_z z = z i_z.$$  \hfill (12)

80
For example, if we apply this formula to the first relation in (12), using the relations (13) we get
\[ i_x \wedge dx = 1 - dx \wedge i_x, \quad i_x \wedge dy = -q^{-1}dy \wedge i_x, \]
\[ i_y \wedge dx = -qdx \wedge i_y, \quad i_y \wedge dy = 1 - dy \wedge i_y, \]
\[ i_z \wedge dx = -qdx \wedge i_z, \quad i_z \wedge dy = -qdy \wedge i_z, \]
\[ i_x \wedge dz = -q^{-1}dz \wedge i_x, \quad i_y \wedge dz = -q^{-1}dz \wedge i_y, \]
\[ i_z \wedge dz = 1 - dz \wedge i_z. \]  

(13)

The commutation relations between the differentials and the inner derivations:

Other relations can be similarly obtained. Consequently, we have the following commutation relations:

The relations of the Lie derivatives with the differentials:

\[ \mathcal{L}_x \alpha = i_x d\alpha + d(i_x \alpha). \]

For example, if we apply this formula to the first relation in (12), using the relations (13) we get
\[ \mathcal{L}_x x = (i_x d + d(i_x))x \]
\[ = 1 + x i_x d + x d i_x \]
\[ = 1 + x \mathcal{L}_x. \]

Other relations can be similarly obtained. Consequently, we have the following commutation relations:

The relations between the Lie derivatives and the elements of \( \mathcal{A} \):

\[ \mathcal{L}_x = 1 + x \mathcal{L}_x, \quad \mathcal{L}_y = q^{-1}y \mathcal{L}_x, \quad \mathcal{L}_z = q^{-1}z \mathcal{L}_x, \]
\[ \mathcal{L}_y = qx \mathcal{L}_y, \quad \mathcal{L}_y = 1 + y \mathcal{L}_y, \quad \mathcal{L}_y = q^{-1}y \mathcal{L}_y, \]
\[ \mathcal{L}_z = qx \mathcal{L}_z, \quad \mathcal{L}_z = qy \mathcal{L}_z, \quad \mathcal{L}_z = 1 + z \mathcal{L}_z. \]  

(15)

The relations of the Lie derivatives with the differentials:

\[ \mathcal{L}_x dx = dx \mathcal{L}_x, \quad \mathcal{L}_x dy = q^{-1}dy \mathcal{L}_x, \quad \mathcal{L}_x dz = q^{-1}dz \mathcal{L}_x, \]
\[ \mathcal{L}_y dx = qdx \mathcal{L}_y, \quad \mathcal{L}_y dy = dy \mathcal{L}_y, \quad \mathcal{L}_y dz = q^{-1}dz \mathcal{L}_y, \]
\[ \mathcal{L}_z dx = qdx \mathcal{L}_z, \quad \mathcal{L}_z dy = qdy \mathcal{L}_z, \quad \mathcal{L}_z dz = dz \mathcal{L}_z. \]  

(16)
Other commutation relations can be similarly obtained. To complete the description of the above scheme, we get below the remaining commutation relations as follows:

- The Lie derivatives and partial derivatives:
  \[
  \mathcal{L}_x \partial_x = \partial_x \mathcal{L}_x, \quad \mathcal{L}_y \partial_y = q \partial_y \mathcal{L}_x, \quad \mathcal{L}_x \partial_y = q \partial_y \mathcal{L}_x, \\
  \mathcal{L}_z \partial_x = q \partial_x \mathcal{L}_z, \quad \mathcal{L}_z \partial_y = q \partial_y \mathcal{L}_z, \quad \mathcal{L}_z \partial_z = \partial_z \mathcal{L}_z.
  \] (17)

- The inner derivations:
  \[
  i_x \wedge i_y = -q i_y \wedge i_x, \quad i_x \wedge i_z = 0, \\
  i_y \wedge i_z = -q i_z \wedge i_y, \quad i_z \wedge i_z = 0.
  \] (18)

- The Lie derivatives and the inner derivations:
  \[
  \mathcal{L}_x i_x = i_x \mathcal{L}_x, \quad \mathcal{L}_x i_y = q \mathcal{L}_x, \quad \mathcal{L}_x i_z = q \mathcal{L}_x, \\
  \mathcal{L}_y i_x = q^{-1} i_x \mathcal{L}_y, \quad \mathcal{L}_y i_y = i_y \mathcal{L}_y, \quad \mathcal{L}_y i_z = q \mathcal{L}_y, \\
  \mathcal{L}_z i_x = q^{-1} i_x \mathcal{L}_z, \quad \mathcal{L}_z i_y = q^{-1} i_y \mathcal{L}_z, \quad \mathcal{L}_z i_z = i_z \mathcal{L}_z.
  \] (19)

- The Lie derivatives:
  \[
  \mathcal{L}_x \mathcal{L}_y = q \mathcal{L}_y \mathcal{L}_x, \quad \mathcal{L}_x \mathcal{L}_z = q \mathcal{L}_z \mathcal{L}_x, \quad \mathcal{L}_y \mathcal{L}_z = q \mathcal{L}_z \mathcal{L}_y.
  \] (20)

These commutation relations are the same with the relations (5).
