Abstract: Generalizing earlier results, sums over the products of the Gaussian \(q\)-binomial coefficients are computed. Some applications of the results for special choices of \(q\) are emphasized. The results are obtained by the elementary technique of partial fraction decomposition.

Key words: Gaussian \(q\)-binomial coefficients, Fibonomial coefficients, partial fraction decomposition, sum identities

1. Introduction

Define the second-order linear sequences \(\{U_n\}\) and \(\{V_n\}\) for \(n \geq 2\) by

\[U_n = pU_{n-1} + U_{n-2}\text{ and } V_n = pV_{n-1} + V_{n-2},\]

with initial values \(U_0 = 0\), \(U_1 = 1\) and \(V_0 = 2\), \(V_1 = p\), respectively.

The Binet formulæ are

\[U_n = \frac{\alpha^n - \beta^n}{\alpha - \beta} = \alpha^{n-1} \frac{1-q^n}{1-q}, \quad V_n = \alpha^n + \beta^n = \alpha^n(1+q^n),\]

where \(\alpha, \beta = \left(p \mp \sqrt{\Delta}\right)/2\) with \(q = \beta/\alpha = -\alpha^{-2}\) and \(\Delta = p^2 + 4\), so that \(\alpha = iq^{-1/2}\).

In the special instance \(p = 1\), the sequences \(\{U_n\}\) and \(\{V_n\}\) are reduced to the Fibonacci sequence \(\{F_n\}\) and the Lucas sequence \(\{L_n\}\), respectively.

For integers \(n\) and \(k\) such that \(n \geq k \geq 0\) and integer \(m\), the generalized Fibonomial coefficients with indices in arithmetic progressions are defined by

\[
\begin{align*}
\left\{ \begin{array}{c} n \\ k \end{array} \right\}_{U; m} &= \frac{U_m U_{2m} \cdots U_{nm}}{(U_m U_{2m} \cdots U_{km})(U_m U_{2m} \cdots U_{(n-k)m})},
\end{align*}
\]

with \(\left\{ \begin{array}{c} n \\ 0 \end{array} \right\}_{U; m} = 1\) and 0 otherwise. When \(m = 1\), we have the generalized Fibonomial coefficients, denoted by \(\left\{ \begin{array}{c} n \\ k \end{array} \right\}_{U}\). When \(U_n = F_n\), then the generalized Fibonomial coefficients are reduced to the usual Fibonomial coefficients, denoted by \(\left\{ \begin{array}{c} n \\ k \end{array} \right\}_F\).

Various sum formulæ including the Fibonomial coefficients with the Fibonacci and Lucas numbers as coefficients have been studied by several authors (for more details, see [9, 10, 13, 16, 17]). For example, Marques and Trojovsky [13] showed that for positive integers \( m \) and \( n \),

\[
\sum_{j=0}^{4n+2} (-1)^{\binom{j+1}{2}} \binom{4m + 2}{j}_F L_{2m+1-j} = -\binom{4m + 2}{4n + 3}_F F_{2m+1}^{4n+3}
\]

and

\[
\sum_{j=0}^{4m} (-1)^{\binom{j}{2}} \binom{4m}{j}_F F_{n+4m-j} = \frac{1}{2} F_{2m+n} 4m \sum_{j=0}^{4m} (-1)^{\binom{j}{2}} \binom{4m}{j}_F L_{2m-j}.
\]

The Gaussian \( q \)-binomial coefficients are defined by

\[
\binom{n}{k}_q = \frac{(q; q)_n}{(q; q)_k (q; q)_{n-k}},
\]

where \( (x; q)_n \) is the \( q \)-Pochhammer symbol, \( (x; q)_n = (1 - x)(1 - xq)\ldots (1 - xq^{n-1}) \) with \( (x; q)_0 = 1 \).

We recall some useful formulæ [1, 6]:

\[
\sum_{k \geq 0} \binom{n+k}{k}_q z^k = \frac{1}{(z; q)_{n+1}}
\]

and

\[
\sum_{k=0}^{n} \binom{n}{k}_q q^{\binom{k+1}{2}} z^k = \prod_{k=1}^{n} (1 + z q^k).
\]

The link between the generalized Fibonomial and Gaussian \( q \)-binomial coefficients is

\[
\binom{n}{k}_{U;m} = \alpha^{mk(n-k)} \binom{n}{k}_q \quad \text{with} \quad q = \beta / \alpha = -\alpha^{-2} \quad \text{or} \quad \alpha = iq^{-1/2}.
\]

Various sum formulæ including the Gaussian \( q \)-binomial coefficients with certain weight functions have been studied by several authors [9, 10]. They also gave some applications by using the link between the generalized Fibonomial and Gaussian \( q \)-binomial coefficients to sums including the generalized Fibonomial coefficients.

Melham [14] derived families of identities between sums of powers of the Fibonacci and Lucas numbers. In his work, while deriving these identities, he conjectured a complex identity between the Fibonacci and Lucas numbers. We recall this conjecture:

(a) Let \( k, m, n \in \mathbb{Z} \) with \( m > 0 \) show that

\[
\sum_{j=0}^{m-1} \frac{F_n^{m+1}}{F_{m-j-1}(m-1) F_{m+1}^{k+m-j}} + (-1)^{\binom{m+3}{2}} \frac{F_n^{m+1}}{\prod_{j=1}^{m} F_{m+1}^{k+j}} = F_{(m+1)(n+\frac{m}{2})},
\]

308
As a particular consequence of the above sum, Kılıç and Arıkan referred to many kinds of combinatorial sums as well as various proof methods. For example, for the method of integral numbers excluding decomposition method three sum identities. For any real numbers \( a \) and \( b \), nonnegative integer \( n \), and integers \( t \) and \( r \) such that \( r \geq -1 \) and \( t \geq -n \):

\[
\sum_{j=0}^{n} \begin{bmatrix} n \backslash j \end{bmatrix}_q (-1)^j q^{(t+1)j+tr} = \frac{1}{(aq^t; q^w)_{r+1}}.
\]

As a particular consequence of the above sum, Kılıç and Arıkan [8] presented a proof of Clark’s conjecture.

More recently, Kılıç and Prodinger [11] presented and proved (using only the elementary partial fraction decomposition method) three sum identities. For any real numbers \( a \) and \( b \):

\[
\text{SUM}_1 = \sum_{k=0}^{n} \begin{bmatrix} n+k \backslash k \end{bmatrix}_q \begin{bmatrix} n \backslash k \end{bmatrix}_q (-1)^k q^{(k+1)k} a - q^k,
\]

\[
\text{SUM}_2 = \sum_{k=0}^{n} \begin{bmatrix} n+k \backslash k \end{bmatrix}_q \begin{bmatrix} n \backslash k \end{bmatrix}_q (-1)^k q^{(k+1)k} \frac{1}{q^{-k} - a},
\]

and

\[
\text{SUM}_3 = \sum_{k=0}^{n} \begin{bmatrix} n+k-1 \backslash k \end{bmatrix}_q \begin{bmatrix} n \backslash k \end{bmatrix}_q (-1)^k q^{(k+1)k} \frac{a - q}{b - q} - k.
\]
In this paper, inspired by the results of [11], we will present and compute a general sum formula including the Gaussian $q$-binomial coefficients with a certain rational-parametric weight function. Namely, we consider the sum $S(n; t, a, p, r)$:

$$S(n; t, a, p, r) = \sum_{k=0}^{n} \binom{n+k}{k}_q \left[ \binom{n}{k}_q \right] (−1)^k q^{(k)(t−n)} \frac{1}{(aq^k;p)_{r+1}}.$$

If one chooses specific values of the parameters, many known formulæ can be derived from the above sum.

For example, one can obtain the three sums from [11] from the sum $S(n; t, a, p, r)$ as follows:

- For any values of $a$ and $p$, setting $r = −1$ in the sum $S(n; t, a, p, r)$, we get $\text{SUM}_1$ as

  $$\text{SUM}_1 = aS(n; 0, \cdot, \cdot, −1) − S(n; 1, \cdot, \cdot, −1).$$

- When $r = 0$, $t = 1$ and $p = q$ in the sum $S(n; t, a, p, r)$, we obtain $\text{SUM}_2$ as

  $$\text{SUM}_2 = S(n; 1, a, q, 0).$$

- Since

  $$\binom{n+k−1}{k}_q \left[ \binom{n}{k}_q \right] = \binom{n+k}{k}_q \left[ \binom{n}{k}_q \right] \frac{1−q^n}{1−q^{n+k}}$$

and

  $$\frac{1}{(1−q^{n+k})(1−bq^{k})} = \frac{1}{(1−bq^{−n})(1−q^{n+k})} + \frac{b}{(b−q^n)(1−bq^k)},$$

we obtain $\text{SUM}_3$ from the sum $S(n; t, a, p, r)$ via

$$\text{SUM}_3 = \frac{1−q^n}{1−bq^{−n}} [S(n; 1, q^n, \cdot, 0) − aS(n; 2, q^n, \cdot, 0)]$$

$$+ \frac{b(1−q^n)}{b−q^n} [S(n; 1, b, \cdot, 0) − aS(n; 2, b, \cdot, 0)].$$

Thus, our results generalize the results of [11].

We use a partial fraction method to prove our claims (for earlier results using this approach, we refer to [2–4, 15]). All identities we will obtain hold for general $p$ and $q$. Finally, we will present some applications of our results for some special choices of $p$ and $q$.

Throughout the paper, we assume that $a$, $q$, and $p$ are nonzero real numbers; $n$ is a nonnegative integer; and $r \geq −1$ is an integer such that $ap^i q^j \neq 1$ for all $i \in \{0, 1, \ldots, n\}$ and $j \in \{0, 1, \ldots, r\}$. 

310
2. The main results

**Theorem 2.1** For positive integer \( t \) such that \( t \leq r + n + 2 \),

\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} q^k \frac{(-1)^k q^k + (t-n)k}{(aq^k; p)_r + 1} = a^t q^{(n+1)/2} \sum_{k=0}^{r} \binom{n}{k} p^{k/2} \frac{(ap^k q^{-n}; q)_n}{(ap^k q)_n (p; p)_r} \times \sum_{k=0}^{n} \frac{(q^{-k} - q) \ldots (q^{-k} - q^n)}{(q q)(q q)_{n-k}} (-1)^k q^{(k+1)/2} \times \frac{1}{(1-z)(1-zq) \ldots (1-zq^n)} \frac{1}{(z-a)(z-ap) \ldots (z-ap^r)} z^t.
\]

**Proof** First we rewrite the LHS of the claim as

\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} q^k \frac{(-1)^k q^k + (t-n)k}{(aq^k; p)_r + 1} = a^t q^{(n+1)/2} \sum_{k=0}^{r} \binom{n}{k} p^{k/2} \frac{(ap^k q^{-n}; q)_n}{(ap^k q)_n (p; p)_r} \times \sum_{k=0}^{n} \frac{(q^{-k} - q) \ldots (q^{-k} - q^n)}{(q q)(q q)_{n-k}} (-1)^k q^{(k+1)/2} \times \frac{1}{(1-z)(1-zq) \ldots (1-zq^n)} \frac{1}{(z-a)(z-ap) \ldots (z-ap^r)} z^t.
\]

Define

\[
h(z) := \frac{(z-a) \ldots (z-ap) \ldots (z-ap^r)}{(1-z)(1-zq) \ldots (1-zq^n)} \frac{1}{(z-a)(z-ap) \ldots (z-ap^r)} z^t.
\]

Then the partial fraction expansion gives us

\[
h(z) = \sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} q^k \frac{(-1)^k q^k + (t-n)k}{(aq^k; p)_r + 1} + \sum_{k=0}^{r} \frac{A_k}{z-ap^k} + \sum_{k=1}^{r} \frac{B_k}{z^k}.
\]

If we multiply both sides of the above equation by \( z \) and then let \( z \to \infty \), we obtain

\[
0 = -\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} q^k \frac{(-1)^k q^k + (t-n)k}{(aq^k; p)_r + 1} + \sum_{k=0}^{r} A_k + B_1,
\]

or

\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} q^k \frac{(-1)^k q^k + (t-n)k}{(aq^k; p)_r + 1} = \sum_{k=0}^{r} A_k + B_1.
\]

Now, for \( 0 \leq k \leq r \), we compute the coefficients \( A_k \) and \( B_1 \) via

\[
A_k = (z-ap^k)h(z) \bigg|_{z=ap^k} \quad \text{and} \quad B_1 = [z^{-1}]h(z).
\]
First consider the coefficients $A_k$:

$$A_k = (z - ap^k) h(z) \bigg|_{z = ap^k} = \frac{(ap^k - q) \ldots (ap^k - q^n)}{(1 - ap^k)(1 - ap^k) \ldots (1 - ap^k) a^{r-t+1} p^{k(r-t+1)}} \times \frac{1}{(ap^k - a)(ap^k - a) \ldots (ap^k - ap^{k-1})} \times \frac{1}{(ap^k - ap^{k+1})(ap^k - ap^{k+2}) \ldots (ap^k - ap^{r})}
$$

$$= \frac{(-1)^n q^\left( \frac{n+1}{2} \right)(ap^k q^{-n}; q)_n}{(ap^k q)_n}
\times \frac{(-1)^k}{a^k p^{k}(1 - p^k)(1 - p^{k-1}) \ldots (1 - p)}
\times \frac{1}{a^{r-k} p^{k(r-k)}(1 - p^k)(1 - p^2) \ldots (1 - p^{r-k})}
= a^{1-t} q^\left( \frac{n+1}{2} \right)(-1)^{n+k} p^{k(r-k+3)} (ap^k q^{-n}; q)_n
\times \frac{(ap^k q^{-n}; q)_n}{(ap^k q)_n}
\times \frac{(p; p)_{k+1}}{(p; p)_{k+1}}.
$$

For the coefficient $B_1$, consider

$$B_1 = [z^{-1}] h(z) = [z^{-2-r+\ell}] \frac{(z - q) \ldots (z - q^n)}{(z; q)_n}
\times \frac{1}{(z - a)(z - a) \ldots (z - a)}
\frac{1}{(q; q)_n}
\times \frac{1}{(1 - z^{-1} q)}
\times \prod_{k=1}^{r} (1 - z^{-1} q)^k
= [z^{-2-r+\ell}] z^n
\times \prod_{k=1}^{r} (1 - z^{-1} q)^k
\times \frac{n + k}{n + k - r}
\sum_{k=0}^{n} \binom{n + k}{k} z^k
\times \sum_{k=0}^{n} \binom{r + k}{k} \frac{z}{(ap^r)^k}
\times \sum_{k=0}^{n} \binom{n + k}{k} (-1)^{k} q^\left( \frac{k+1}{2} \right) z^{-k}
= \frac{(-1)^{r+1}}{a^{r+1} p^{r+1}} [z^{-2-r+\ell - n}] \sum_{k=0}^{n} \binom{n + k}{k} (-1)^{k} q^\left( \frac{k+1}{2} \right) z^{-k},
$$

where

$$c_k = \sum_{l=0}^{k} a_l b_{k-l},$$

with

$$a_l = \binom{r + l}{l} \frac{1}{a^l p^l} \text{ and } b_l = \binom{n + l}{l} \frac{1}{q}.$$
Finally, for \( t \leq n + r + 2 \), we get

\[
B_1 = \frac{(-1)^{r+1}}{a^{r+1}p^{(r+1)/2}} [z^{-2-r+t-n}] \sum_{k=0}^{n} c_k z^k \sum_{k=0}^{n} \binom{n}{k} q^{(k+1)/2} z^{-k} = \frac{(-1)^{r+1}}{a^{r+1}p^{(r+1)/2}} \sum_{k=0}^{t-r-2} c_k \binom{n}{t-r-2-k} (-1)^{k+n+r-t} q^{(k+2+n+r-t)/2} 
\]

\[
= -(-1)^{n+t} a^{-r-1} q^{n+r+3} p^{(-r+1)/2} \times \sum_{k=0}^{t-r-2} (-1)^k q^{(k+1)/2 + (2+n+r-t)} \binom{n}{t-r-2-k} c_k,
\]

as claimed. \( \Box \)

In Theorem 2.1, we assumed \( t \) to be a positive integer. Now we separately consider the case \( t = 0 \) with the following result.

**Theorem 2.2**

\[
\sum_{k=0}^{n} \binom{n+k}{k} q^{\binom{k}{2} - nk} \frac{1}{(aq^k; p)_{r+1}} = (-1)^n q^{-\binom{n+1}{2}} + a(-1)^n q^{\binom{n+1}{2}} \sum_{k=0}^{r} (-1)^k p^{1/k(k+3)} \frac{(ap^k q^{-n}; q)_n}{(aq^k; q)_{n+1}(p; p)_{k+1}(p; p)_{r-k}}.
\]

**Proof** Define

\[
h(z) := \frac{(z-q) \ldots (z-q^n)}{(1-z)(1-zq) \ldots (1-zq^n)} \frac{z^{r+1}}{(z-a)(z-ap) \ldots (z-ap^r)}.
\]

By partial fraction expansion, we write

\[
h(z) = \sum_{k=0}^{n} \binom{n+k}{k} q^{\binom{k}{2} - nk} \frac{1}{(1-zq^k)(aq^k; p)_{r+1}} + \sum_{k=0}^{r} A_k \frac{z}{z-ap^k}.
\]

Since \( \lim_{z \to \infty} zh(z) = (-1)^{n+1} q^{-\binom{n+1}{2}} \), we write

\[
(-1)^{n+1} q^{-\binom{n+1}{2}} = - \sum_{k=0}^{n} \binom{n+k}{k} q^{\binom{k}{2} - nk} \frac{1}{(aq^k; p)_{r+1}} + \sum_{k=0}^{r} A_k,
\]

where \( A_k = (z-ap^k)h(z) \mid_{z=ap^k} \) for \( 0 \leq k \leq r \). Thus, the proof follows. \( \Box \)

Now we present some corollaries of Theorem 2.1.

**Corollary 2.3**

\[
\sum_{k=0}^{n} \binom{n+k}{k} q^{\binom{k+1}{2} - nk} \frac{1}{(aq^k; p)_{r+1}} = (-1)^n q^{\binom{n+1}{2}} \sum_{k=0}^{r} (-1)^k p^{\binom{k+1}{2}} \frac{(ap^k q^{-n}; q)_n}{(aq^k; q)_{n+1}(p; p)_{k+1}(p; p)_{r-k}}.
\]
Proof If we choose \( t = 1 \), then \( \binom{k}{2} + k = \binom{k+1}{2} \) and \(-r - 1 < 0\). By Theorem 2.1, the result follows.

**Corollary 2.4** For any positive integer \( t \) such that \( t < r + 2 \),

\[
\sum_{k=0}^{n} \binom{n+k}{k} q \binom{k}{q}^{-1}(t-n)k \frac{1}{(aq^{k+1}; p)_{r+1}} = a^{1-t} q^{\binom{n+1}{2}} \sum_{k=0}^{r} (-1)^k p^k q^{k(2t+3)} \frac{(ap^k q^{-n}; q)_n}{(ap^k; q)_{n+1}(p; p)_{r-k}}.
\]

**Proof** Since \( t - r - 2 < 0 \), the last sum in the RHS of Eq. (2.1) equals 0 and so the claim follows.

**Corollary 2.5** For any positive integer \( t \) such that \( t \leq n + 1 \),

\[
\sum_{k=0}^{n} \binom{n+k}{k} q \binom{k}{q}^{-1}(t-n)k = (-1)^{n+t+1} q^{\binom{n+2}{2} + n(t+1)} \sum_{k=0}^{t-1} \binom{n+k}{k} q^t - 1 - k \binom{n}{t-1-k} q^{(k+1)k + (n-t+1)}.
\]

**Proof** The claim follows from Theorem 2.1 with \( r = -1 \).

3. Further corollaries

In this section, we will present several generalized Fibonomial-Fibonacci-Lucas sum identities as corollaries of our results.

**Corollary 3.1** For \( n \geq 0 \),

\[
\sum_{k=0}^{n} \binom{n+k}{k} U \binom{k}{k} U (-1)^{nk+\binom{k+1}{2}} \frac{1}{U_{n+k+1} V_{n+k+2} U_{n+k+3}} = (-1)^{\binom{n+1}{2}} \left[ \binom{2n+2}{n} U \binom{1}{2} V_1 - \binom{2n+1}{n+1} V \binom{1}{2} U_1 + \binom{2n+3}{n+1} U \binom{1}{2} U_3 \right],
\]

where \( \Delta = p^2 + 4 \) is defined as before.

**Proof** Note that \( \Delta = (\alpha - \beta)^2 = -q^{-1}(1-q)^2 \). Thus, this sum can be equivalently rewritten in \( q \)-form as

\[
\frac{(1-q)^2}{\alpha^{2n+4}} \sum_{k=0}^{n} \binom{n+k}{k} q \binom{k}{q} (1-q^{n+k+1})(1+q^{n+k+2})(1-q^{n+k+3}) \frac{(-1)^k q^{2n+k+2k}+n(1-q)}{(1-q^{2n+1})(1+q)^2}.
\]

Applying Corollary 2.4 to the above sum on LHS for the parameters \( t = r = 2 \), \( a = q^{n+1} \), and \( p = -q \), it equals

\[
(-1)^{-\frac{2}{2}} q^{\frac{1}{4}n^2+n+1}(1-q)^2 \sum_{k=0}^{2} \frac{(-1)^k q^{2k(1-k)^2}q^{k-1}n}{(1-q^{n+1}; q)_{n+1}(q^{-2}; q)_{2-k}}
\]

\[
= (-1)^{-\frac{2}{2}} q^{\frac{1}{4}n^2+n+1} \left[ \frac{q(q;q)_n(1-q)}{(q^{n+1}; q)_{n+1}(1+q)^2} - \frac{(-q^2;q)_n(1-q)^2}{(-q^{n+2}; q)_{n+1}(1+q)^2} - \frac{q(q^3;q)_n(1-q)^2}{(q^{n+3}; q)_{n+1}(1+q)(1-q^2)} \right].
\]
After some algebraic operations and simplifications, the claim follows.

**Corollary 3.2** For \( n \geq 0 \),
\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} (-1)^{nk+\binom{k}{2}} \frac{V_{k+2}}{U_{n+k+1}U_{n+k+3}} = (-1)^{\binom{n+1}{2}+1} \frac{U_{n+2}}{U_2} \left\{ \binom{2n+1}{n} \right\}^{-1} \frac{V_{n-1}}{U_{n+1}U_{n+2}} - \frac{U_{n+2}}{U_{2n+3}}.
\]

**Proof** We rewrite the claim in \( q \)-form as follows:
\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} q^{\binom{k}{2}+(1-n)\binom{k}{2}} (-1)^{\binom{k}{2}} \frac{1 + q^{k+2}}{(1 - q^{n+k+1})(1 - q^{n+k+3})} \quad (3.1)
\]
\[
= q^{\binom{n}{2}+1}(-1)^n \frac{1 - q^{n+2}}{1 - q^2} \left\{ \binom{2n+1}{n} \right\}^{-1} \frac{1 + q^{n-1}}{(1 - q^{n+1})(1 - q^{n+2})} - \frac{1 - q^{n+2}}{1 - q^{2n+3}}.
\]

Consider the LHS of Eq. (3.1) as
\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} q^{\binom{k}{2}+k(1-n)} (-1)^{\binom{k}{2}} \frac{1 + q^{k+2}}{(1 - q^{n+k+1})(1 - q^{n+k+3})}
\]
\[
= S(n; 1, q^{n+1}, q^2, 1) + q^2 S(n; 2, q^{n+1}, q^2, 1).
\]

By Theorem 2.1, we have that
\[
S(n; 1, q^{n+1}, q^2, 1) = q^{\binom{n+1}{2}}(-1)^n \left[ \frac{(q; q)_n}{(q^{n+1}; q)_{n+1}(1 - q^2)} - q^2 \frac{(q^3; q)_n}{(q^{n+3}; q)_{n+1}(1 - q^2)} \right]
\]
and
\[
S(n; 2, q^{n+1}, q^2, 1) = q^{\binom{n}{2}}(-1)^n \left[ \frac{(q; q)_n}{(q^{n+1}; q)_{n+1}(1 - q^2)} - \frac{(q^3; q)_n}{(q^{n+3}; q)_{n+1}(1 - q^2)} \right].
\]

The claim follows now after some simplifications.

**Corollary 3.3** For \( n \geq 1 \),
\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} \alpha^{-k}(-1)^{nk+\binom{k+1}{2}} U_k U_{k+2} = \Delta^{-1/2}(-1)^{\binom{n}{2}} U_{n^2+n \alpha^2} - (-1)^n \beta n^2 n^2 U U_{n+1}.
\]

**Proof** If we convert the claim into \( q \)-form, then we have to prove that
\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} (-1)^{k} q^{\binom{k}{2}-nk} (1 - q^n - q^{k+2} + q^{2k+2})
\]
\[
= (-1)^n \left[ q^{\binom{n}{2}}(1 - q^{n^2+n}) - q^{\binom{n}{2}} - q^{\binom{n}{2}} \frac{1 - q^n}{1 - q} \right].
\]

Represent the LHS as
\[
\sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} (-1)^{k} q^{\binom{k}{2}-nk} (1 - q^n - q^k + q^{2k+2}) = T_0 - (1 + q^2)T_1 + q^2T_2,
\]

\[315\]
with
\[ T_j = \sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} \frac{(-1)^{k} q^{(k)^2 + (j-n)k}}{q^{k+1} k q_{n+k+1}}, \]
for \( 0 \leq j \leq 2 \). By Theorem 2.2 and Corollary 2.5, we get
\[ T_1 = (-1)^n q^{-(n+1)} \frac{1}{2}, \quad T_2 = (-1)^n q^{(n+1)} \]
and
\[ T_3 = (-1)^n q^{(n)} \left[ \frac{1 - q^n}{1 - q} - q^n \frac{1 - q^{n+1}}{1 - q} \right]. \]
After some simplifications, we obtain
\[ T_0 - (1 + q^2)T_1 + q^2T_2 = (-1)^n q^{-(n+1)} \left( 1 - q^n \right) - (-1)^n q^{(n+2)} \frac{1}{1 - q}, \]
which equals the RHS of Eq. (3.2). Thus, we have the conclusion. \( \square \)

**Corollary 3.4** For \( n \geq 3 \),
\[ \sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} (-1)^{n+k+1} \frac{1}{U_{k+1} U_{k+2} U_{k+3}} = 0. \]

**Proof** If we convert the LHS of the claim into \( q \)-form, we get
\[ \frac{(1 - q)^3}{\alpha^3} \sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} (-1)^{n+k+1} \frac{1}{q^{k+1}} \frac{1}{q_{n+k+1}}, \]
which, by Corollary 2.4, equals
\[ \frac{(1 - q)^3}{\alpha^3} q^{(n+1)} (-1)^n \sum_{k=0}^{2} (-1)^{k} q^{k} \frac{(q^{k+1-n}, q_{n+k+1})}{(q^{k+1}; q, q_{k+1})}, \]
which, since \( (q^{k+1-n}, q_{n+k+1}) = 0 \) for \( k = 0, 1, 2 \) and \( n \geq 3 \), equals 0, as claimed. \( \square \)

Now we recall an auxiliary result from [15], for which we will prove a \( q \)-analogue.

**Corollary 3.5** For \( 0 \leq m \leq n \),
\[ \sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} (-1)^{n-k} \frac{m+k}{j (j+m+k)} = \frac{1}{j} - \frac{(j+m-1)!2}{(j+m-n-1)! (j+m+n)!}. \]

**Proof** Consider the sum
\[ s_n = \sum_{k=0}^{n} \binom{n+k}{k} \binom{n}{k} (-1)^{n-k} \frac{1 - q^{m+k}}{1 - q^{m+k}} = (-1)^n [S(n; 0, q^{j+m}, 0) - q^n S(n; 1, q^{j+m}, 0)]. \]
Since \( \lim_{q \to 1} \frac{1-q^n}{1-q} = n \), we observe that

\[
\frac{1}{j} \lim_{q \to 1} s_n = \sum_{k=0}^{n} \binom{n+k}{k} (-1)^{n-k} \frac{m+k}{j(j+m+k)}.
\]

By Theorems 2.1 and 2.2,

\[
s_n = (-1)^n [S(n; 0, q^{j+m}, J_0) - q^n S(n; 1, q^{j+m}, J_0)]
\]

\[
= q^{-\frac{n+1}{2}} + \binom{n+1}{j+m} \frac{(q^{j+m-n}; q)_n}{(q^{j+m}; q)_{n+1}} - q^{\frac{n+1}{2}} + m \frac{(q^{j+m-n}; q)_n}{(q^{j+m}; q)_{n+1}} (1 - q^j)
\]

\[
= q^{-\frac{n+1}{2}} - q^{\frac{n+1}{2}} + m \frac{(q^{j+m-n}; q)_n}{(q^{j+m}; q)_{n+1}} (1 - q^j).
\]

Multiplying this by \( \frac{1}{j} \) and then performing the limit \( q \to 1 \), we finally have

\[
\frac{1}{j} \lim_{q \to 1} s_n = \frac{1}{j} - \frac{(j+m-1)!}{(j+m-n-1)!(j+m+n)!},
\]

and so the proof is complete. \( \square \)

The above example is a prototype of how to deduce binomial sum identities from our main results by performing the limit \( q \to 1 \).
