ON THE STABILITY RESULTS FOR THIRD ORDER DIFFERENTIAL-OPERATOR EQUATIONS

Varga Kalantarov & Aydin Tiryaki

Abstract
Sufficient conditions for the stability and the global asymptotic stability of the zero solution of third order linear differential-operator equations are established.

Key words: Differential-Operator Equations, Stability, Global asymptotic stability

1 Introduction
Several problems of mathematical physics are leading to the initial-boundary value problems for evolutionary partial differential equations of third order which can be realized as third order differential-operator equations in some Hilbert space (see [3], [4], [7], [8], and the references therein).

There are many results on solvability of the Cauchy problem for the higher order differential-operator equations (see [1], [2], [2], [6], [9]). In the literature, there are many articles devoted to the stability and instability of solutions of the first and second order differential-operator equations. But little is known about the third order equations.

Our aim is to study the problem of stability and global asymptotic stability of the zero solution of third order linear differential-operator equations.

2 Main Results
Let $H$ be a real Hilbert space with the inner product $(.,.)$ and norm $\| . \|$. We will consider in $H$ the following third order equation:

$$u''' + Au'' + Bu' + Cu = 0,$$

where $A, B$ and $C$ are linear (not necessarily bounded), positive-definite and self adjoint operators. The domains of definition of these operators $D(A), D(B)$ and $D(C)$ are dense linear subspaces of $H$. The symbol $'''$ stands for differentiation with respect to $t$.

Our first result is the following,
Theorem 2.1 Let the operators $A$, $B$ and $C$ be as above. Suppose that $D(B) \subseteq D(C)$ and there exist positive numbers $\sigma$ and $\gamma_1$ such that

$$\alpha \gamma_1 > 1$$

(2)

and

$$\alpha \|u\|^2 \leq (Au, u), \forall u \in D(A)$$

(3)

$$(Cu, u) \leq \gamma_1^{-1}(Bu, u), \forall u \in D(B)$$

(4)

Then the zero solution of the equation (1) is stable in the sense of the norm

$$\|u''\|^2 + \|A^{1/2}u'\|^2 + \|B^{1/2}u'\|^2 + \|C^{1/2}u\|^2.$$ 

(5)

Proof. Assume that $u = u(t)$ is an arbitrary solution of the equation (1). Taking the inner product in $H$ of (1) with $u'' + \epsilon u'$, we obtain

$$0 = (u''' + Au'' + Bu' + Cu'' + \epsilon u')$$

$$= \frac{1}{2} \frac{d}{dt} \|u''\|^2 + \|A^{1/2}u''\|^2 + \frac{1}{2} \frac{d}{dt} \|B^{1/2}u'\|^2 + (Cu, u'') +$$

$$+ \epsilon (u'', u') + \frac{\epsilon}{2} \frac{d}{dt} \|A^{1/2}u'\|^2 + \epsilon \|B^{1/2}u'\|^2 + \frac{\epsilon}{2} \frac{d}{dt} \|C^{1/2}u\|^2$$

where $\epsilon$ is a positive number which will be specified below. It follows that

$$\frac{d}{dt} \left[ \frac{1}{2} \|u''\|^2 + \frac{\epsilon}{2} \|A^{1/2}u'\|^2 + \frac{1}{2} \|B^{1/2}u'\|^2 + \frac{\epsilon}{2} \|C^{1/2}u\|^2 +$$

$$+ \epsilon (u'', u') + (C^{1/2}u, C^{1/2}u') \right] + \|A^{1/2}u''\|^2 +$$

$$+ \epsilon \|B^{1/2}u'\|^2 - \epsilon \|u''\|^2 - \|C^{1/2}u\|^2 = 0.$$ 

(6)

Let us denote by $\Phi(u(t))$ the following expression

$$\Phi(u(t)) = \frac{1}{2} \|u''\|^2 + \frac{\epsilon}{2} \|A^{1/2}u'\|^2 + \frac{1}{2} \|B^{1/2}u'\|^2 +$$

$$+ \frac{\epsilon}{2} \|C^{1/2}u\|^2 + \epsilon (u'', u') + (C^{1/2}u, C^{1/2}u').$$

(7)

Using the standard inequality: $ab \leq \frac{\alpha}{2} a^2 + \frac{\beta}{2} b^2$, the Schwarz’s inequality and conditions (3), (4) we can get:
\[ \varepsilon \|u'', u'\| \leq \frac{1}{2(1 + \varepsilon_0)} \|u''\|^2 + \frac{\varepsilon^2(1 + \varepsilon_0)}{2\alpha} \|A^{1/2}u'\|^2 \]

\[ \|(C^{1/2}u, C^{1/2}u')\| \leq \|C^{1/2}u\| \|B^{1/2}u'\| \gamma_1^{-1/2} \leq \frac{1 - \varepsilon_1}{2} \|B^{1/2}u'\|^2 + \frac{1}{2\gamma_1(1 - \varepsilon_1)} \|C^{1/2}u\|^2, \]

where \( \varepsilon_0 \) and \( \varepsilon_1 \) are positive constants to be chosen below.

Hence due to (8) and (9) we find the following estimation of \( \Phi(u(t)) \) from below:

\[ \Phi(u(t)) \geq \frac{1}{2} \frac{\varepsilon_0}{1 + \varepsilon_0} \|u''\|^2 + \frac{1}{2} (\varepsilon - \frac{\varepsilon^2(1 + \varepsilon_0)}{\alpha}) \|A^{1/2}u'\|^2 + \frac{\varepsilon_1}{2} \|B^{1/2}u'\|^2 + \frac{1}{2} (\varepsilon - \frac{1}{\gamma_1(1 - \varepsilon_1)}) \|C^{1/2}u\|^2. \]

From our main condition (2) it is clear that there is a positive number \( \alpha' < \alpha \) such that

\[ \alpha' \gamma_1 > 1. \]

We can also choose \( \varepsilon_0 \) and \( \varepsilon_1 \) such that

\[ d_0 \equiv \frac{1}{2} [\alpha' - \frac{(\alpha')^2(1 + \varepsilon_0)}{\alpha}], d_1 \equiv \frac{1}{2\gamma_1} [\alpha' \gamma_1 - \frac{1}{1 - \varepsilon_1}] \]

are positive. So taking \( \varepsilon = \alpha' \) in (10) we obtain:

\[ \Phi(u(t)) \geq \frac{1}{2} \frac{\varepsilon_0}{1 + \varepsilon_0} \|u''\|^2 + \frac{\varepsilon_1}{2} \|B^{1/2}u'\|^2 + d_0 \|A^{1/2}u'\|^2 + \]
\[ \quad + d_1 \|C^{1/2}u\|^2. \]

Therefore \( \Phi \) is a Lyapunov functional for (1) and the zero solution of (1) is stable. This completes the proof of Theorem 1.

**Theorem 2.2** Suppose that all conditions of the Theorem 2.1 are satisfied. Assume also that \( D(B) = D(C) \subseteq D(A) \) and there exist positive numbers \( \beta \) and \( \gamma_2 \) such that

\[ \beta(Au, u) \leq (Bu, u), \quad \forall u \in D(B) \]

\[ \beta(Au, u) \leq (Bu, u), \quad \forall u \in D(B) \]

181
Then the zero solution of the equation (1) is globally asymptotically stable in the sense of the norm

$$\| u'' \|^2 + \| B^{1/2} u' \|^2 + \| C^{1/2} u \|^2.$$  \hfill (15)

Moreover every solution of the Cauchy problem for the equation (1) tends to zero with an exponential rate.

**Proof.** Let us take the scalar product in $H$ of (1) with $u$:

$$\frac{d}{dt}[(u'', u) - \frac{1}{2} \|u'\|^2 + (A^{1/2} u', A^{1/2} u) + \frac{1}{2} \|B^{1/2} u\|^2] + \|C^{1/2} u\|^2 - \|A^{1/2} u'\|^2 = 0. \hfill (16)$$

Assume that $\eta$ is a positive parameter. Multiply (16) by $\eta$ and add to (6):

$$\frac{d}{dt}[\Phi(u) + \eta(u'', u) - \frac{\eta}{2} \|u'\|^2 + \eta(A^{1/2} u', A^{1/2} u) + \frac{\eta}{2} \|B^{1/2} u\|^2] + \|A^{1/2} u''\|^2 + \alpha' \|B^{1/2} u'\|^2 - \alpha' \|u''\|^2 - \|C^{1/2} u'\|^2 + \eta \|C^{1/2} u\|^2 - \eta \|A^{1/2} u'\|^2 = 0. \hfill (17)$$

Denote by $\Psi(u(t))$ the following expression

$$\Psi(u(t)) \equiv \Phi(u) + \eta(u'', u) - \frac{\eta}{2} \|u'\|^2 + \eta(A^{1/2} u', A^{1/2} u) + \frac{\eta}{2} \|B^{1/2} u\|^2. \hfill (18)$$

Using the Schwarz’s inequality and the conditions (3), (13), (14) for sufficiently small $\eta$ we have

$$\Psi(u(t)) \geq \nu_1(\|u''\|^2 + \|B^{1/2} u'\|^2 + \|C^{1/2} u\|^2) \hfill (19)$$

where $\nu_1$ is a positive parameter depending on $\alpha, \beta, \gamma_1$ and $\gamma_2$. It is also not difficult to see that there exists a positive parameter $\nu_2 = \nu_2(\alpha, \beta, \gamma_1, \gamma_2)$ such that

$$\Psi(u(t)) \leq \nu_2(\|u''\|^2 + \|B^{1/2} u'\|^2 + \|C^{1/2} u\|^2) \hfill (20)$$

for each solution $u(t)$ of the equation (1).

By using (3), (13) and (14) we can get from (17), (18) and (20), the following inequality

182
\[
\frac{d}{dt} \Psi(u(t)) + \delta \Psi(u(t)) = \delta \Psi(u(t)) - \| A^{1/2} u'' \|^2 - \alpha' \| B^{1/2} u' \|^2 + \alpha' \| u' \|^2 + \\
+ \| C^{1/2} u' \|^2 \eta \| C^{1/2} u \|^2 + \eta \| A^{1/2} u' \|^2 \\
\leq - (\alpha - \alpha' - \delta \nu_2) \| u'' \|^2 - (\eta - \delta \nu_2) \| C^{1/2} u \|^2 - \\
- (\alpha' - \eta \beta^{-1} - \gamma^{-1} - \delta \nu_2) \| B^{1/2} u' \|^2
\]

where \( \delta \) is some positive parameter.

Since the parameters \( \alpha, \alpha' \) satisfy (2) and (11) respectively we can choose \( \eta \) and \( \delta \) so small that:

\[
\frac{d}{dt} \Psi(u(t)) + \delta \Psi(u(t)) \leq 0. \tag{21}
\]

From the inequalities (19) and (21) it follows that \( \Psi \) is a Lyapunov functional for (1). Moreover this inequalities imply:

\[
\| u''(t) \|^2 + \| B^{1/2} u'(t) \|^2 + \| C^{1/2} u(t) \|^2 \leq \frac{\nu_2}{\nu_1} e^{-\delta t}(\| u''(0) \|^2 + \\
+ \| B^{1/2} u'(0) \|^2 + \| C^{1/2} u(0) \|^2).
\]

Thus the zero solution of (1) is globally asymptoticaly stable and every solution of the Cauchy problem for the equation (1) is tending to zero with an exponential rate. Hence the proof of Theorem 2 is completed. \( \square \)

3 Applications

The above results give us possibility to investigate various partial differential equations and systems of partial differential equations.

Example 3.1 Let \( \Omega \subset \mathbb{R}^n \) be bounded domain with sufficiently smooth boundary \( \partial \Omega \). Consider in \( \Omega \times (0, \infty) \) the equation

\[
u_{ttt} + a_1 \nu_{tt} - a_2 \Delta \nu_t - a_3 \Delta \nu = 0. \tag{22}
\]

where \( a_1, a_2 \) and \( a_3 \) are some positive constants.

This equation is one of the mathematical models describing small movements of compressible relaxing medium ([8]).

Theorem 2.2 gives us possibility to prove that under some condition on \( a_1, a_2, a_3 \) every solution of (22) satisfying the boundary condition

\[183\]
u|_{\partial \Omega} = 0 \quad (23)

tends to zero with an exponential rate.

In fact (22), (23) can be written in the form (1), where \( A = a_1 I, B = -a_2 \Delta, C = -a_3 \Delta, H = L_2(\Omega), D(A) = L_2(\Omega) \) and \( D(B) = D(C) = W_2^2(\Omega) \cap W_2^1(\Omega) \). Since

\[
(A(u(\cdot,t), u(\cdot,t))) = a_1 \int_{\Omega} u^2(x,t)dx = a_1 \| u(\cdot,t) \|^2,
\]

it is clear that the inequality (3) holds with \( \alpha = a_1 \). Due to the Poincare Friedrichs inequality

\[
\int_{\Omega} |\nabla u(x,t)|^2 dx \geq \lambda_1 \int_{\Omega} u^2(x,t)dx,
\]

we obtain

\[
\begin{align*}
(Bu(\cdot,t), u(\cdot,t)) &= -a_2 \int_{\Omega} (\Delta u(x,t), u(x,t))dx = a_2 \int_{\Omega} |\nabla u(x,t)|^2 dx \\
&\geq a_2 \lambda_1 \int_{\Omega} u^2(x,t)dx = a_2 \lambda_1 \| u(\cdot,t) \|^2 \\
&= \frac{a_2}{a_1} \lambda_1 (Au(\cdot,t), u(\cdot,t))
\end{align*}
\]

where \( \lambda_1 > 0 \) is the first eigenvalue of the problem

\[
-\Delta \psi = \lambda \psi, \quad \psi|_{\partial \Omega} = 0. \quad (24)
\]

Therefore the inequality (13) holds with \( \beta = \frac{a_2}{a_1} \lambda_1 \).

Finally, since \( B = \frac{a_2}{a_3} C \) the conditions (4) and (14) are satisfied with \( \gamma_1^{-1} = \gamma_2 = \frac{a_2}{a_3} \). Thus we reach the statement of the following:

**Corollary 3.1** If the positive constants \( a_1, a_2 \) and \( a_3 \) satisfy the condition \( a_1 a_2 - a_3 > 0 \), then the zero solution of the equation (22) is globally asymptotically stable in the sense of the norm

\[
\| u(\cdot,t) \|^2 + \| \nabla u(\cdot,t) \|^2 + \| \nabla u(\cdot,t) \|^2. \quad (25)
\]
Remark Let \( \psi_k(x) \) be the \( k - th \) eigenfunction corresponding to the eigenvalue \( \lambda_k \) of the problem (24) and suppose that \( v_k(t) \) is the solution of the equation

\[
v''_k(t) + a_1 v'_k(t) + \lambda_k a_2 v_k(t) + a_3 \lambda_k v_k(t) = 0.
\]

Then it is clear that the function \( u_k(x, t) = v_k(t) \psi_k(x) \) is the solution of (22) – (23). The standard analysis of the equation (26) allows us to get the following assertion:

If \( a_1, a_2 \) and \( a_3 \) satisfy the condition \( a_1 a_2 - a_3 < 0 \), then the zero solution of the problem (22) – (23) is unstable.

Example 3.2 Consider now in \( \Omega \times (0, \infty) \) the equation

\[
u_{ttt} - a_1 \Delta u_{tt} - a_2 \Delta u_t - a_3 \Delta u = 0.
\] (26)

Proceeding as in Example 3.1 we obtain the following:

Corollary 3.2 If the coefficients \( a_1, a_2, a_3 \) are positive constants and satisfy the condition \( \lambda_1 a_1 a_2 > a_3 \), then the zero solution of the equation (27) is globally asymptotically stable in the sense of the norm (25).
