

Checklist of metazoan parasites recorded in Anura and Urodela from Turkey

Hikmet Sami YILDIRIMHAN*, Sezen İNCEDOĞAN

Department of Biology, Faculty of Arts and Sciences, Uludağ University, Görükle Campus, Nilüfer, Bursa, Turkey

Received: 13.09.2012 • Accepted: 17.04.2013 • Published Online: 12.08.2013 • Printed: 06.09.2013

Abstract: A checklist of metazoan parasites of Anura and Urodela in Turkey has been compiled from parasitological studies done in Turkey between 1960 and 2013. The list of parasite species is arranged by phylum and class, providing parasite name, location of the caught Anura and Urodela hosts, and date of published record. Seventy parasite species belonging to phylum Platyhelminthes (including 7 species of Monogenea, 24 species of Digenea, and 2 species of Cestoda), phylum Nematelminthes (including 30 species of Nematoda), phylum Acanthocephala (6 species), and phylum Annelida (1 species) are listed from 24 host species, which were collected from different parts of Turkey. The parasite–host list is organized on a taxonomic basis and provides information for the species of host(s) infected, the known geographic distribution in Turkey, and the published sources for each host and locality record.

Key words: Anura, Urodela, metazoan, parasite, Turkey

1. Introduction

This study summarizes the current literature as to parasites of Anura and Urodela from Turkey. Over the years, there have been many taxonomic studies, especially of the helminths of some animals from Turkey. There are 16 Anura and 16 Urodela species in Turkey (Budak and Göçmen, 2005; Frost, 2010). The first study on helminthes of Anura and Urodela was performed by Schad in 1960. Most of the helminthological studies on these animals were carried out after 1995. Recently, a review study about helminth parasites of Turkish anurans was conducted (Amin et al., 2012). Today, all of Anura, with the exception of *Pelobates fuscus*, and all of Urodela, with the exceptions of *Lyciasalamandra helverseni*, *Lyciasalamandra flavimembris*, *Neurergus crocatus*, *Salamandra salamandra*, *Salamandra infraimmaculata*, *Ommatotriton ophryticus*, and *Lissotriton vulgaris*, have been studied helminthologically. Consequently, 70 species of Anura and Urodela parasites were recorded in Turkey.

The aim of this review was to assist researchers by presenting a checklist of helminth parasite species of Anura and Urodela from Turkey.

2. Materials and methods

All relevant published papers from 1960 to 2013 were examined. The studies performed concerned the parasites of anurans and urodeles from different regions of Turkey. Forty-two papers were used in the checklist.

3. Results

There are 70 species of parasites that are associated with host specimens. Parasites inhabit Anura and Urodela inner organs, especially the gastrointestinal system. The phylum Nematelminthes is dominant with 30 species, followed by the phylum Platyhelminthes.

4. Discussion

Forty-two studies about parasites of Anura and Urodela have been published in Turkey since 1960. Thirty-four of them were about Anura. Seven of them were about Urodela and 1 of them was about both Anura and Urodela. Fifty-two species out of 70 parasite species were found in Anura, 10 parasite species were found in Urodela, and 8 parasite species were found in both Urodela and Anura. The information about these parasite–host species is given in Table 1. All of detailed knowledge about parasite species has been presented in Table 2. Fifty-two of these parasite species have been described at species level, while 18 of them have been described at genus level. Schad et al. (1960) showed distribution of *Bufo regularis* in Turkey, but it has been established in recent systematic papers that this species has no distribution in Turkey (Frost 2010).
