Received 14.05.2007

Vertilecanin C and 2 new phenyl-substituted derivatives of vertilecanin A were synthesized. Lithiation of 5-benzoylpicolinamide with BuLi at -78 °C followed by treatment with methyl bromoacetate gave vertilecanin C [methyl 2-(3-benzoylpicolinamido)acetate], a natural product. Vertilecanin A type phenopicolinic acid derivatives were synthesized starting from nicotinic acid in 4 steps. Chlorination of nicotinic acid with SOCl<sub>2</sub> followed by treatment with anisole in the presence of AlCl<sub>3</sub> gave (4-methoxyphenyl)(pyridin-3-yl)methanone. The Minisci reaction of the ketone afforded 5-(4methoxybenzoyl)picolinamide. TiCl<sub>4</sub>-catalyzed acidic hydrolysis of the picolinamide gave 5-(4-methoxybenzoyl)picolinic acid, from which 5-(hydroxy(4-methoxyphenyl)methyl)picolinic acid was obtained by selective reduction with NaBH<sub>4</sub>. The same reaction sequence performed with toluene instead of anisole afforded 5-(hydroxy(p-tolyl)methyl)picolinic acid.

Key Words: Vertilecanin A, Vertilecanin C, diarylketones, Nicotinic acid.

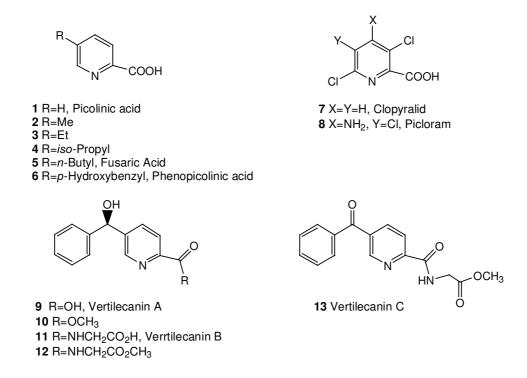

#### Introduction

Picolinic acid and its derivatives are known as important organic compounds for humans and animals. Picolinic acid (1) itself plays a significant role in carrying metal ions in the human body and in animals.<sup>1</sup> Calcium, magnesium, and potassium salts of picolinic acid are used as food and beverage supplements to improve the nutritive capacity of food stuffs and beverages.<sup>2</sup> 5-Alkylpicolinic acids 2-5, which are known as hypotensive agents, are reported to have strong inhibitory effects on dopamine  $\beta$ -hydroxylase.<sup>3</sup> Phenopicolinic acid 6, originally isolated from cultures of a *Paecilomyces* sp., is a dopamine  $\beta$ -hydroxylase inhibitor and shows antihypertensive activity.<sup>4</sup> Halogen- containing picolinic acids 7-8 have been widely used as herbicides in agriculture and are potential contaminants of groundwater.<sup>5</sup> The need for new sources of environmentally friendly pesticides and fungi displaying a 'broad spectrum' of parasitic abilities has

 $<sup>^{*} {\</sup>rm Corresponding\ authors}$ 

Synthesis of Vertilecanin C and Two New Derivatives of..., S. DEMIRCI, et al.,

been increasing. For this purpose, Soman et al. isolated 5 new fungal metabolites, the vertilecanins **9-13**, from solid–substrate fermentation cultures of *Verticillium lecanii*. While **10-13** did not have insecticidal or antifungal activity, the most abundant component, vertilecanin A (**9**), displayed insecticidal activity against *Helicoverpa zea* (a corn butterfly) and showed antibacterial activity against *Bacillus subtilis* (ATCC 6051).<sup>6</sup>

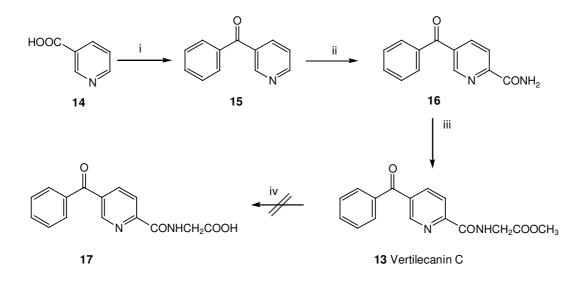

Recently, we described a methodology<sup>7</sup> for the preparation of vertilecanin A starting from nicotinic acid in 4 steps with an overall yield of 29%. As a part of this ongoing project, we now report the first synthetic preparation of vertilecanin C and 2 phenyl-substituted derivatives of vertilecanin A.

#### **Results and Discussion**

The first step for synthesis of vertilecanin C (13) was the preparation of 3-benzoylpyridine (15) from nicotinic acid by following the literature procedure.<sup>8</sup> Nicotinic acid was chlorinated with SOCl<sub>2</sub> followed by treatment with benzene in the presence of AlCl<sub>3</sub> to give 3-benzoylpyridine (15). 3-Benzoylpyridine was converted to carboxamide 16 by following the procedure described by Langhals et al.<sup>9</sup> The most critical step in the synthesis was the alkylation of the amide with a suitable alkylating reagent. Lithiation of carboxamide 16 at -78 °C with BuLi followed by treatment with methyl 2-bromoacetate readily gave vertilecanin C (13). We considered that a chemoselective hydrolysis of the ester group of 13 followed by a chemoselective reduction of the keto group should afford vertilecanin B (11). For the chemoselective hydrolysis of the ester group, different acidic or basic hydrolysis procedures were applied. Unfortunately, all these methods failed to give the carboxylic acid 17 but instead the amide bond hydrolyzed to form 5-benzoylpicolinic acid<sup>7</sup> (Scheme 1). Therefore, although vertilecanin C was synthesized from nicotinic acid in 3 steps with an overall yield of 37%, conversion of vertilecanin C to vertilecanin B failed.

Synthesis of Vertilecanin C and Two New Derivatives of..., S. DEMİRCİ, et al.,

**Scheme 1.** (i) SOCl<sub>2</sub>, then C<sub>6</sub>H<sub>6</sub>, AlCl<sub>3</sub>, reflux, 90%; (ii) FeSO<sub>4</sub>.7H<sub>2</sub>O, H<sub>2</sub>SO<sub>4</sub>, t-BuOOH, HC(O)NH<sub>2</sub>, 50%; (iii) THF, BuLi, -78 °C; then BrCH<sub>2</sub>COOCH<sub>3</sub>, 82% (iv) (a) K<sub>2</sub>CO<sub>3</sub>, MeOH, (b) KOH, MeOH, H<sub>2</sub>O; (c) HCl, H<sub>2</sub>O, MeOH.

In the second part of this work, we aimed to synthesize phenyl-substituted derivatives of vertilecanin A. For this purpose, the Friedel-Crafts acylation of nicotinic acid was performed with anisole and toluene. The chlorination of nicotinic acid (14) with SOCl<sub>2</sub> followed by treatment with anisole afforded the nicotinyl ketone 18. Ketone 18 was converted to the corresponding carboxyamide 19 by the known Minisci procedure.<sup>9</sup> Fisher et al. have reported the Ti(IV) catalyzed mild hydrolysis or alcoholysis of amides.<sup>10</sup> Following this procedure, TiCl<sub>4</sub>-catalyzed hydrolysis of carboxyamide 19 gave carboxylic acid 20 in a good yield. A surprising result in the chemoselective reduction of the keto group of 20 was the formation of the ether 22 as a side product (21:22= 4:1 according to <sup>1</sup>H-NMR spectra). Because of the insolubility of the carboxylic acid 20 in MeOH, this reaction was performed in EtOH. Therefore, we wanted to elucidate the reaction mechanism for the formation of 22. The mixture of compounds 21 and 22 was converted to the ester derivative (23) by refluxing in EtOH in the presence of pTSA. The formation of the etheric ester 23 as a sole product implies that the reaction proceeds via an S<sub>N</sub>1 mechanism because of the electron-donor effect of 4-OMe on the phenyl ring.

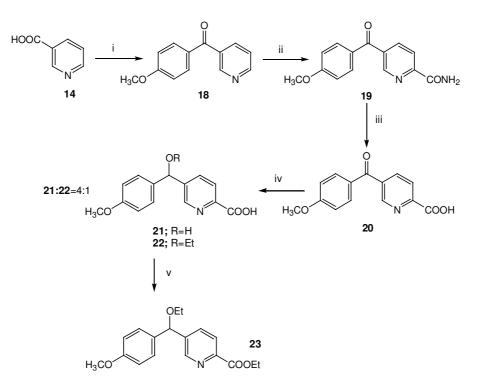

The reaction sequence shown in Scheme 3 is similar to those in Schemes 1 and 2, except for the products formed in the Minisci reaction of ketone 24. This reaction gave isomeric carboxyamides 25 and 26 in a ratio of 1:1. After separation, these carboxyamides were converted to the corresponding carboxylic acids 27 and 28. Selective reduction of the keto-carboxylic acid 27 with NaBH<sub>4</sub> gave the corresponding hydroxy-carboxylic acid 29, a vertilecanin A analogue.

In summary, using nicotinic acid (14) as a key compound, we achieved the first total synthesis of vertilecanin C (13), a natural product. We also described the synthesis of 2 new phenyl substituted analogues of vertilecanin A, which can be used for further chemical and biological purposes.

#### Experimental

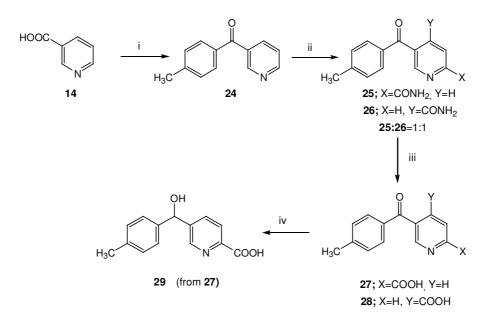

**General.** Solvents were purified and dried by standard procedures before use. Melting points were determined on a Büchi 539 capillary melting apparatus and are uncorrected. Infrared spectra were obtained

(+/-)-Vertilecanin C [methyl 2-(5-benzoylpicolinamido)acetate](13). A solution of carboxamide 16 (0.60 g, 2.6 mmol) dissolved in THF (25 mL) was cooled to -78 °C. At the same temperature and under  $N_2$  atmosphere, 1.8 mL of n-BuLi (1.6 M, 2.9 mmol) was added dropwise and the mixture was stirred for 1 h. To the reaction mixture was added methyl bromoacetate (0.45 g, 2.7 mmol) and the temperature was raised to rt. The mixture was stirred for 12 h at rt. After removal of THF at reduced pressure, 1 mL of  $H_2O$  was added and the organic phase was extracted with  $CH_2Cl_2$  (3 × 40 mL). Combined organic phases were washed with water  $(2 \times 5 \text{ mL})$  and dried (Na<sub>2</sub>SO<sub>4</sub>). Removal of the solvent and chromatography of the residue on a short  $Al_2O_3$  column (15 g) eluting with hexane-CHCl<sub>3</sub> (70:30; 50:50; 30:70) gave vertilecanin C (13) as a colorless oil (0.65 g, 82%). <sup>1</sup>H-NMR (200 MHz, CDCl<sub>3</sub>):  $\delta$  8.95 (d, 1H, H-C(6), J<sub>4,6</sub>=2.0 Hz); 8.52 (bt, 1H, NH,  $J_{NH,CH2}=5.5$  Hz); 8.32 (A part of AB system, d, 1H, H-C(3),  $J_{3,4}=8.1$  Hz); 8.23 (B part of AB system, d, 1H, H-C(3),  $J_{3,4}=8.1$  Hz); 8.23 (B part of AB system, d, 1H, H-C(3),  $J_{3,4}=8.1$  Hz); 8.23 (B part of AB system, d, 1H, H-C(3),  $J_{3,4}=8.1$  Hz); 8.23 (B part of AB system, d, 1H, H-C(3),  $J_{3,4}=8.1$  Hz); 8.23 (B part of AB system, d, 1H, H-C(3),  $J_{3,4}=8.1$  Hz); 8.23 (B part of AB system, d, 1H, H-C(3),  $J_{3,4}=8.1$  Hz); 8.23 (B part of AB system) (B part of AB s of AB system, dd, 1H, H-C(4), J<sub>3,4</sub>=8.1 Hz; J<sub>4,6</sub>=2.0 Hz), 7.81 (quasi d, 2H, H-C(2') and H-C(6'), J=8.1 Hz); 7.70-7.49 (m, 3H, H-C(3'), H-C(4'), H-C(5')), 4.30 (d, 2H, CH<sub>2</sub>,  $J_{NH,CH_2}$ =5.5 Hz), 3.80 (s, 3H, OCH<sub>3</sub>). <sup>13</sup>C-NMR (50 MHz, CDCl<sub>3</sub>):  $\delta$  194.1 (CO, ketone); 169.9 (CO, ester); 163.7 (CO, amide); 151.5 (C(2)); 149.3 (C(6)); 138.5 (C(4)); 136.5 (C(1')); 135.4 (C(5)); 133.5 (C(4')); 130.0 (C(2'/6')); 128.7 (C(3'/5')); 128.7 (C(3' 121.9 (C(3)); 52.3 (OCH<sub>3</sub>); 41.3 (CH<sub>2</sub>). Reduction of ketone 20 with NaBH<sub>4</sub>. The reduction procedure described for the synthesis of (+/-)-vertilecanin A<sup>7</sup> was applied to 5-(4-methoxy-benzoyl)-pyridine-2-carboxylic acid (20) in EtOH to give 5-[hydroxy-(4-methoxy-phenyl)-methyl]-pyridine-2-carboxylic acid (21). This reaction gave an inseparable mixture of corresponding alcohol 21 and ether 22 in a ratio of 4:1 as a white solid (the total yield of the mixture was 84%). Only the alcohol 21 could be characterized from <sup>1</sup>H-NMR spectrum of the product mixture.

**5-[Hydroxy-(4-methoxy-phenyl)-methyl]-pyridine-2-carboxylic acid** (21). <sup>1</sup>H-NMR (200 MHz, DMSO-d<sub>6</sub>):  $\delta$  8.87 (bs, 1H, H-C(6)); 8.60 (d, 1H, H-C(3), J<sub>3,4</sub>=8.1 Hz); 8.47 (bd, 1H, H-C(4), J<sub>3,4</sub>=8.1 Hz); 7.33 (AA' part of AA'XX' system, quasi d, 2H, H-C(2') and H-C(6'), J=8.7 Hz); 6.92 (XX' part of AA'XX' system, quasi d, 2H, H-C(5'), J=8.7 Hz); 6.03 (bs, OH); 5.49 (s, 1H, H-C(OH)); 3.77 (s, 3H, OCH<sub>3</sub>).

5-[Ethoxy-(4-methoxy-phenyl)-methyl]-pyridine-2-carboxylic acid ethyl ester (23). To a stirred solution of 21 and 22 (4:1) (0.50 g, 1.90 mmol) in EtOH (25 mL) was added p-toluene sulfonic acid (70 mg) and the reaction mixture was refluxed for 24 h. The reaction mixture was allowed to cool to rt and the solvent was removed by evaporation. The residue was dissolved in EtOAc (50 mL) and washed with saturated  $Na_2CO_3$  solution (3 × 10 mL). After drying of the organic layer over  $Na_2SO_4$ , the solvent was evaporated. The filtration of the residue from silica gel (10 g) with 1:5 EtOAc-hexane gave 5-[ethoxy-(4-methoxy-phenyl)-methyl]-pyridine-2-carboxylic acid ethyl ester (23) as a colorless oil (0.46 g, 77%). <sup>1</sup>H-NMR (200 MHz, CDCl<sub>3</sub>):  $\delta$  8.75 (d, 1H, H-C(6), J<sub>4,6</sub>=2.1 Hz); 8.11 (A part of AB system, d, 1H, H-C(3), J<sub>3.4</sub>=8.1 Hz); 7.85 (B part of AB system, dd, 1H, H-C(4), J<sub>3.4</sub>=8.1 Hz, J<sub>4.6</sub>=2.1 Hz); 7.26 (AA' part of AA'XX' system, quasi d, 2H, H-C(2') and H-C(6'), J=8.7 Hz); 6.88 (XX' part of AA'XX' system, quasi d, 2H, H-C(3') and H-C(5'), J=8.7 Hz); 5.44 (s, 1H, H-C-OEt); 4.47 (q, 2H, OCH<sub>2</sub> of ester, J=7.1 Hz); 3.78 (s, 3H, OCH<sub>3</sub>); 3.61-3.42 (m, 2H, OCH<sub>2</sub> of ether); 1.44 (t, 3H, CH<sub>3</sub>, J=7.1 Hz); 1.28 (t, 3H, CH<sub>3</sub>, J=7.0 Hz). <sup>13</sup>C-NMR (50 MHz, CDCl<sub>3</sub>):  $\delta$  167.1 (COOEt); 161.6 (C(4')); 150.6 (C(6)); 149.2 (C(2)); 144.2 (C(5)); 137.0 (C(4)); 135.0 (C(1')); 130.4 (C(2'/6')); 126.8 (C(3)); 116.2 (C(3'/5')); 82.7 (CHOEt); 66.6 (CH<sub>2</sub>, ester); 63.8 (CH<sub>2</sub>, ether); 57.3 (OCH<sub>3</sub>); 17.3 (CH<sub>3</sub>); 16.4 (CH<sub>3</sub>). Anal. Calcd. for C<sub>18</sub>H<sub>21</sub>NO<sub>4</sub> (315.36): C, 68.55; H, 6.71; N, 4.44. Found: C, 68.42; H, 6.58; N, 4.55. EIMS (m/z, %): 315.8 (M<sup>+</sup>, 1); 270.8  $(M^+-OCH_2CH_3, 14); 242.0 (M^+-COOCH_2CH_3, 6); 178.6 (M^+-MeOC_6H_4/C_2H_6, 10); 165.6 (PyrCOOEt^+, 10); 165.6 (PyrCOEt^+, 10); 165.6 (Py$ 61); 137.5 (MeOC<sub>6</sub>H<sub>4</sub>CHOH<sup>+</sup>, 65); 135.5 (MeOC<sub>6</sub>H<sub>4</sub>CO<sup>+</sup>, 38); 109.5 (50); 94.5 (47); 77.3 (C<sub>5</sub>H<sub>3</sub>N<sup>+</sup>, 100).

**p-Tolyl-3-pyridinylmethanone** (24). The literature procedure<sup>8</sup> described for the synthesis of phenyl-3-pyridinylmethanone (15) was applied to nicotinyl chloride by using toluene instead of benzene

to give p-tolyl-3-pyridinylmethanone (24) (45%). mp 75-76 °C (from CH<sub>2</sub>Cl<sub>2</sub>-hexane); lit.<sup>12</sup> mp 78.0-78.5 °C. <sup>1</sup>H-NMR (200 MHz, CDCl<sub>3</sub>):  $\delta$  8.91 (bs, 1H, H-C(2)); 8.73 (bd, 1H, H-C(6), J<sub>5,6</sub>=4.9 Hz); 8.02 (dt, 1H, H-C(4), J<sub>4,5</sub>=8.1 Hz, J<sub>2,4</sub>=J<sub>4,6</sub>=1.8 Hz); 7.66 (AA' part of AA'XX' system, quasi d, 2H, H-C(2') and H-C(6'), J=7.9 Hz); 7.39 (dd, 1H, H-C(5), J<sub>4,5</sub>=8.1 Hz, J<sub>5,6</sub>=4.9 Hz); 7.24 (XX' part of AA'XX' system, quasi d, 2H, H-C(3') and H-C(5'), J=7.9 Hz); 2.38 (s, 3H, CH<sub>3</sub>). <sup>13</sup>C-NMR (50 MHz, CDCl<sub>3</sub>):  $\delta$  196.4 (CO, ketone); 154.5 (C(2)); 152.7 (C(6)); 146.0 (C(4')); 139.0 (C(4)); 136.0 (C(3) or C(1')); 135.5 (C(3) or C(1')); 132.2 (C(2'/6')); 131.2 (C(3'/5')); 125.2 (C(5)); 23.6 (CH<sub>3</sub>).

The Minisci reaction of p-tolyl-3-pyridinyl methanone (24). To a stirred solution of pyridin-3yl-p-tolyl-methanone (24) (8.00 g, 40.6 mmol) in formamide (10 mL) was added concentrated H<sub>2</sub>SO<sub>4</sub> (4 mL) under N<sub>2</sub> at 0 °C. After the addition of FeSO<sub>4</sub>.7H<sub>2</sub>O (22.70 g, 81.6 mmol) in one portion, t-BuOOH (70%, 9.1 mL, 65.8 mmol) was added dropwise in 1 h under N<sub>2</sub> at the same temperature. The reaction mixture was stirred at the same temperature for 1 h then at rt for 7 h. The reaction mixture was cooled to 0 °C, and to this mixture was added a solution containing H<sub>2</sub>O (16.2 mL), KOH (22.74 g, 406 mmol), and citric acid (28.06, 146 mmol). This mixture was poured into a separatory funnel containing ice (100 g), and then dilute NaOH was added (pH 12). The mixture was extracted with EtOAc (3 × 60 mL). The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub>. The removal of the solvent gave a mixture of 5-(4-methyl-benzoyl)-pyridine-2-carboxamide (25) and 3-(4-methyl-benzoyl)-isonicotinamide (26) in a ratio of 1:1 (4.5 g, total yield 46%). Recrystallization of the mixture from EtOH gave 5-(4-methyl-benzoyl)-pyridine-2-carboxamide (25) as a white solid (1.50 g, 15%). Recrystallization of the residue from EtOAc-hexane gave 3-(4-methyl-benzoyl)-isonicotinamide (26) as a white solid (1.00 g, 10%).

**5-(4-Methyl-benzoyl)-pyridine-2-carboxamide (25)**. mp 203-205 °C (from EtOH). <sup>1</sup>H-NMR (200 MHz, DMSO-d<sub>6</sub>):  $\delta$  8.89 (dd, 1H, H-C(6), J<sub>4,6</sub>=2.0, J<sub>3,6</sub>=0.9 Hz); 8.31 (bs, 1H, H-NH); 8.28 (A part of AB system, dd, 1H, H-C(4), J<sub>3,4</sub>=8.0, J<sub>4,6</sub>=2.0 Hz); 8.20 (B part of AB system, 1H, H-C(3), J<sub>3,4</sub>=8.0, J<sub>3,6</sub>=0.9 Hz); 7.86 (bs, 1H, H-NH); 7.76-7.72 (AA' part of AA'XX' system, quasi d, 2H, H-C(2') and H-C(6'), J=8.0 Hz); 7.44-7.40 (XX' part of AA'XX' system, quasi d, 2H, H-C(3'), H-C(5'), J=8.0 Hz); 2.44 (s, 3H, CH<sub>3</sub>). <sup>13</sup>C-NMR (50 MHz, DMSO-d<sub>6</sub>):  $\delta$  195.4 (CO, ketone); 167.1 (CONH<sub>2</sub>); 154.2 (C(2)); 150.5 (C(6)); 146.0 (C(4')); 140.3 (C(4)); 136.9 (C(5)); 135.3 (C(1')); 131.9 (C(2'/6')); 131.2 (C(3'/5')); 123.5 (C(3)); 23.0 (CH<sub>3</sub>).
