## Pushouts of Profinite Crossed Modules and $\text{cat}^1$ -profinite groups\*

*Murat Alp and Özgün Gürmen*

### Abstract

In this paper, we presented a brief review of crossed modules [7],  $\text{cat}^1$ -groups [6], pullback crossed modules [4], pullback  $\text{cat}^1$ -group [1], profinite crossed modules [5],  $\text{cat}^1$ -profinite groups [5], pullback profinite crossed modules [5], pullback  $\text{cat}^1$ -profinite groups [3]. We defined the pushout  $\text{cat}^1$ -profinite groups and gave the left adjoint constructions.

**Key Words:** Crossed modules,  $\text{Cat}^1$ -groups, Profinite groups, Pushout, Pullback, Adjoint.

### 1. Introduction

Crossed module was introduced by J. H. C. Whitehead in [7]. In [6], Loday reformulated the notion of a crossed module as a  $\text{cat}^1$ -groups and showed that the category  $\mathbf{XMod}$  is equivalent to the category  $\mathbf{Cat}^1$ .

In section 2, we recall the basic properties of crossed modules and their morphisms and  $\text{cat}^1$ -groups and their morphisms. Section 3 includes the definition of pullback crossed modules, which is defined by Brown and Higgins in [4], and the definition of pullback  $\text{cat}^1$ -groups is due to Alp in [1]. We introduced profinite crossed modules and  $\text{cat}^1$ -profinite groups which are defined by Korkes and Porter in [5] in Section 4. Section 5 includes pullback profinite crossed modules which is defined by Korkes and Porter in

[5] and pullback  $\text{cat}^1$ -profinite groups which is defined by Alp in [3]. In Section 6, we gave the definitions of pushout profinite crossed modules which is defined by Korkes and Porter in [5] and pushout  $\text{cat}^1$ -profinite groups. In section 7, we presented left adjoint construction of pushout  $\text{cat}^1$ -profinite group and combined the pictures of pullback  $\text{cat}^1$ -profinite groups and pushout  $\text{cat}^1$ -profinite group together.

## 2. Crossed Modules and $\text{Cat}1$ -Groups

In this section we recall the descriptions of two equivalent categories which are  $\mathbf{XMod}$ , the category of crossed modules and their morphisms;  $\mathbf{Cat1}$ , the category of  $\text{cat}^1$ -groups and their morphisms.

A crossed module  $\mathcal{X} = (\partial : S \rightarrow R)$  consists of a group homomorphism  $\partial$ , called the *boundary* of  $\mathcal{X}$ , together with an action  $\alpha : R \rightarrow \text{Aut}(S)$  satisfying, for all  $s, s' \in S$  and  $r \in R$ ,

$$\begin{aligned} \mathbf{XMod\ 1:} \quad \partial(s^r) &= r^{-1}(\partial s)r \\ \mathbf{XMod\ 2:} \quad s^{\partial s'} &= s'^{-1}ss'. \end{aligned}$$

The standard examples of crossed modules can be found in [1].

A morphism between two crossed modules  $\mathcal{X}_1$  and  $\mathcal{X}_2$  is a pair  $(\sigma, \rho)$ , where  $\sigma : S_1 \rightarrow S_2$  and  $\rho : R_1 \rightarrow R_2$  are homomorphisms satisfying

$$\partial_2 \sigma = \rho \partial_1, \quad \sigma(s^r) = (\sigma s)^{\rho r}.$$

When  $\mathcal{X}_2 = \mathcal{X}_1$  and  $\sigma, \rho$  are automorphisms then  $(\sigma, \rho)$  is an automorphism of  $\mathcal{X}_1$ . The group of automorphisms is denoted by  $\text{Aut}(\mathcal{X}_1)$ .

The notion of a crossed modules is reformulated as a  $\text{cat}^1$ -group by Loday in [6]. For computational purposes we find it convenient to define a  $\text{cat}^1$ -group  $\mathcal{C} = (e; t, h : G \rightarrow R)$  as a group  $G$  with two surjections  $t, h : G \rightarrow R$  and an embedding  $e : R \rightarrow G$  satisfying:

$$\begin{aligned} \mathbf{Cat\ 1:} \quad te &= he = \text{id}_R, \\ \mathbf{Cat\ 2:} \quad [\ker t, \ker h] &= \{1_G\}. \end{aligned}$$

A morphism  $\mathcal{C}_1 \rightarrow \mathcal{C}_2$  of  $\text{cat}1$ -groups is a pair  $(\gamma, \rho)$  where  $\gamma : G_1 \rightarrow G_2$  and  $\rho : R_1 \rightarrow R_2$  are homomorphisms satisfying

$$h_2 \gamma = \rho h_1, \quad t_2 \gamma = \rho t_1, \quad e_2 \rho = \gamma e_1$$

The crossed module  $\mathcal{X}$  associated to  $\mathcal{C}$  has  $S = \ker t$  and  $\partial = h|_S$ . The  $\text{cat}^1$ -group associated to  $\mathcal{X}$  has  $G = R \times S$ , using the action from  $\mathcal{X}$ , and

$$t(r, s) = r, h(r, s) = r(\partial s), er = (r, 1).$$

### 3. Pullback Crossed modules and Pullback $\text{Cat}^1$ -groups

Let  $\mathcal{X} = (\partial : S \rightarrow R)$  be a crossed  $R$ -module and  $\iota : Q \rightarrow R$  be a morphism of groups. Then  $\iota^*\mathcal{X} = (\partial^\bullet : \iota^*S \rightarrow Q)$  is the pullback of  $\mathcal{X}$  by  $\iota$ , where  $\iota^*S = \{(q, s) \in Q \times S \times Q \mid \iota q = \partial s\}$  and  $\partial^\bullet(q, s) = q$ . The action of  $Q$  on  $\iota^*S$  is given by

$$(q_1, s)^q = (q^{-1}q_1q, s^{\iota q}). \tag{3.1}$$

The verification of the crossed module axioms is given in [4].

A pullback  $\text{cat}^1$ -group is defined by Alp in [1] as follows.

Let  $\mathcal{C} = (e; t, h : G \rightarrow R)$  be a  $\text{cat}^1$ -group and let  $\iota : Q \rightarrow R$  be a group homomorphism. Define  $\iota^{**}\mathcal{C} = (e^{**}; t^{**}, h^{**} : \iota^{**}G \rightarrow Q)$  to be the pullback of  $G$  where

$$\iota^{**}G = \{(q_1, g, q_2) \in Q \times G \times Q \mid \iota q_1 = tg, \iota q_2 = hg\},$$

$t^{**}(q_1, g, q_2) = q_1$ ,  $h^{**}(q_1, g, q_2) = q_2$  and  $e^{**}(q) = (q, eq, q)$ . Multiplication in  $\iota^{**}G$  is componentwise. The pair  $(\pi, \iota)$  is a morphism of  $\text{cat}^1$ -groups where  $\pi : \iota^{**}G \rightarrow G$ ,  $(q_1, g, q_2) \mapsto g$ .

A verification of the  $\text{cat}^1$ -group axioms is given in [1].

4. Profinite crossed modules and  $\text{cat}^1$ -profinite groups

A profinite crossed module [5]  $\mathcal{P}\mathcal{X} = (\partial : S \rightarrow R)$  is a crossed module in which  $S$  and  $R$  are profinite groups,  $S$  acts continuously on  $R$  and  $\partial$  is a continuous group homomorphism.

Examples of profinite crossed module were given in [5].

**Proposition 4.1** Let  $\partial : A \rightarrow G$  and  $\delta : B \rightarrow G$  be two profinite crossed modules and let  $(\phi, Id) : (\partial : A \rightarrow G) \rightarrow (\delta : B \rightarrow G)$  be a morphism of profinite crossed modules. Then by defining a continuous  $B$ - action on  $A$  by  ${}^b a = \delta^{(b)} a$  we have  $\phi : A \rightarrow B$  is a profinite crossed module [5].

**Proof.** We can show two crossed modules axioms as follows:

$$\begin{array}{ccc}
 A & \xrightarrow{\phi} & B \\
 \partial \downarrow & & \downarrow \delta \\
 G & \xrightarrow{\text{id}} & G
 \end{array}$$

where  $\partial = \delta\phi$  and  $\phi({}^g a) = {}^g \phi(a)$ . We can verify the axioms of crossed modules as follows:

XMod1:

$$\begin{aligned}
 \phi({}^b a) &= \phi(\delta^b a) \\
 &= \delta^b(\phi a) \\
 &= b\phi(a)b^{-1}
 \end{aligned}$$

XMod2:

$$\begin{aligned}
 \phi a_2 a_1 &= \delta(\phi a_2) a_1 \\
 &= \delta\phi(a_2)(a_1) \\
 &= \partial a_2 a_1 \\
 &= a_2 a_1 a_2^{-1}
 \end{aligned}$$

□

If  $\mathcal{P}\mathcal{X} = (\partial : S \rightarrow R)$  and  $\mathcal{P}\mathcal{X}' = (\partial' : S' \rightarrow R')$  are profinite crossed modules and  $(\mu, \eta) : (\partial : S \rightarrow R) \rightarrow (\partial' : S' \rightarrow R')$  is a morphism between them in which the pair  $(\mu, \eta)$  are both continuous then the pair  $(\mu, \eta)$  is called a morphism of profinite crossed modules [5].

A  $\text{cat}^1$ -profinite group [5] is a  $\text{cat}^1$ -group  $\mathcal{C} = (e; t, h : G \rightarrow R)$  in which  $G$  is a profinite group and  $t$  and  $h$  are continuous endomorphisms of  $G$ .

A morphism of  $\text{cat}^1$ -profinite groups is a morphism  $\phi : \mathcal{C} = (e; t, h : G \rightarrow R) \rightarrow \mathcal{C}' = (e'; t', h' : G' \rightarrow R')$  of the underlying  $\text{cat}^1$ -groups such that  $\phi$  is a continuous morphism of profinite groups.

### 5. Pullbacks of Profinite Crossed modules and $\text{cat}^1$ -profinite groups

Let  $\mathcal{P}\mathcal{X} = (\partial : S \rightarrow R)$  be a profinite crossed module and  $\iota : Q \rightarrow R$  be a continuous homomorphism of profinite groups. Then  $\iota^{**}\mathcal{X} = (\partial^{**} : \iota^{**}S \rightarrow Q)$  is the pullback of  $\mathcal{P}\mathcal{X}$  by  $\iota$ . So that  $\iota^{**}S \subset Q \times S$  is a closed subgroup given by

$$\iota^{**}S = \{(q, s) \in Q \times S \mid \iota q = \partial s\}$$

and  $Q$  acts continuously on the right of  $\iota^{**}S$  by

$$(q_1, s)^q = (q^{-1}q_1q, s^{\iota q}),$$

since  $\partial^{**}(q_1, s) = q_1$ . The verification of crossed module axioms can be found in [5].

A pullback  $\text{cat}^1$ -profinite group is defined by Alp in [3] as follows. Let  $\mathcal{P}\mathcal{C} = (e; t, h : G \rightarrow R)$  be a  $\text{cat}^1$ -profinite group and  $\iota : Q \rightarrow R$  be a continuous homomorphism. Then  $e^{**}; t^{**}, h^{**} : \iota^{**}G \rightarrow Q$  is a pullback of  $G$  where  $\iota^{**}G \subset Q \times G \times Q$  and

$$\iota^{**}G = \{(q_1, g, q_2) \in Q \times G \times Q \mid \iota q_1 = tg, \iota q_2 = hg\}.$$

Now we can define tail, head and embedding as follows:

$$\begin{aligned} t^{**}(q_1, g, q_2) &= q_1 \\ h^{**}(q_1, g, q_2) &= q_2 \\ e^{**}(q) &= (q, e\iota q, q). \end{aligned}$$

The verification of  $\text{cat}^1$ -group axioms can be found in [3].

## 6. Pushouts of Profinite Crossed Modules and $\text{Cat}^1$ -profinite groups

Let  $PX = (\partial : S \rightarrow R)$  be a profinite crossed module over  $R$  and let  $\phi : R \rightarrow H$  be a continuous homomorphism of profinite groups. Consider profinite group  $\phi_*(S)$  topologically generated by the profinite space  $S \times H$  with relations

1.  $(s_1, h)(s_2, h) = (s_1 s_2, h)$
2.  $({}^r s, h) = (s, h\phi(r))$
3.  $(s_1, h_1)(s_2, h_2)(s_1, h_1)^{-1} = (s_2, h_1(\phi\partial s_1)h_1^{-1}h_2)$

for all  $h, h_1, h_2 \in H, s, s_1, s_2 \in S$  and  $r \in R$ .

Define a continuous homomorphism  $\delta : \phi_*(S) \rightarrow H$  by extending  $\delta(s, h) = h(\phi\partial s)h^{-1}$  to the whole of  $\phi_*(S)$  and define a continuous  $H$ -action on the left of  $\phi_*(S)$  by  ${}^h(s, h_1) = (s, hh_1)$  for  $h, h_1 \in H, s \in S$  and a continuous homomorphism  $\psi : S \rightarrow \phi_*(S)$  by  $\psi(s) = (s, 1)$  [5].

**Proposition 6.1** [5] With the notation above,  $\delta : \phi_*(S) \rightarrow H$  is a profinite crossed module over  $H$ .

**Proof.** The statement about continuity are fairly trivial and the axioms of crossed module were checked in [5] as follows.

XMod1:

$$\begin{aligned} \delta({}^h(s, h_1)) &= \delta(s, hh_1) \\ &= hh_1(\phi\partial s)(hh_1)^{-1} \\ &= h(\delta(s, h_1))h^{-1} \end{aligned}$$

XMod2:

$$\begin{aligned} \phi a_2 a_1 &= \delta(\phi a_2) a_1 \\ &= \delta\phi(a_2)(a_1) \\ &= \partial a_2 a_1 \\ &= a_2 a_1 a_2^{-1} \end{aligned}$$

□

A pushout  $\text{cat}^1$ -profinite group is defined as

Let  $C = (e, t, h : G \rightarrow R)$  be a  $\text{cat}^1$ -group and let  $\phi : R \rightarrow H$  be a continuous group homomorphism. Define  $e_{**}, t_{**}, h_{**} : \phi_*G \rightarrow H$  to be the pushout of  $G$  where

$$\phi_* = \{(h_1, s, h_2) \in H \times S \times H\}$$

$$\begin{aligned} t_{**}(h_1, s, h_2) &= h_1 \\ h_{**}(h_1, s, h_2) &= h_2 \\ e_{**}(h) &= (h, e\phi^{-1}h, h). \end{aligned}$$

The pair  $(\psi, \phi)$  is a pair morphism of  $\text{cat}^1$ -profinite groups where  $\psi : G \rightarrow \phi_*G, s \mapsto (h_1, s, h_2)$ . We can show that  $t_{**}$  and  $h_{**}$  are homomorphisms.

$$\begin{aligned} t_{**}\{(h_1, s_1, h_2)(h_3, s_2, h_4)\} &= t_{**}(h_1h_3, s_1s_2, h_2h_4) \\ &= h_1h_3 \\ &= t_{**}(h_1, s_1, h_2)t_{**}(h_3, s_2, h_4). \end{aligned}$$

Now we can give the verification of  $\text{cat}^1$ -group axioms as follows:

CAT1:

$$\begin{aligned} h_{**}e_{**}(h) &= h_{**}(h_1, e\phi^{-1}h, h) = h \\ t_{**}e_{**}(h) &= t_{**}(h_1, e\phi^{-1}h, h) = h. \end{aligned}$$

So,  $t_{**}e_{**} = h_{**}e_{**} = \text{id}_H$  then CAT1 is satisfied.

CAT2:

Suppose  $a = (h'_1, s_1, h_1) \in \ker t_{**}$ ,  $b = (h_2, s_2, h'_2) \in \ker h_{**}$ . Then  $h'_1 = h'_2 = 1$  so, by the definition of  $\phi_{**}$ , we have  $s_1 \in \ker t$ ,  $s_2 \in \ker h$ . Then  $[a, b] = (1_H, [s_1, s_2], 1_H) = (1_H, 1_S, 1_H)$ .

**7. Construction of the left adjoint**

**Proposition 7.1** The category of  $\text{cat}^1$ -profinite groups is cocomplete.

**Proposition 7.2** The functor  $\phi_{**} : \text{Cat}^1 \text{ProGrp}/U \rightarrow \text{Cat}^1 \text{ProGrp}/R$  has a left adjoint  $\phi_{**} : \text{Cat}^1 \text{ProGrp}/R \rightarrow \text{Cat}^1 \text{ProGrp}/U$ .

The proofs of above propositions are clear since left adjoint construction of pullback  $\text{cat}^1$ -groups was given in [2].

Combining pictures together we get the following diagram.

$$\begin{aligned}\phi t^{**} &= t_{**}\psi\pi \\ h_{**}\psi\pi &= \phi h^{**}.\end{aligned}$$

Since

$$\begin{aligned}\phi t^{**}(q_1, g, q_2) &= \phi\iota(q_1) \\ &= (\phi t)(g) \\ &= (t^{**}\psi)(g) \\ &= t^{**}(\psi g) \\ &= t^{**}(q_1, g, q_2) \\ &= q_1 \\ t_{**}\psi\pi(q_1, g, q_2) &= t_{**}\psi(g) \\ &= t_{**}(q_1, g, q_2) \\ &= q_1\end{aligned}$$

diagram is commutative.
